

AN INTRODUCTION TO WORKFLOWS WITH DAGMAN

Presented by Lauren Michael

Covered In This Tutorial

- Why Create a Workflow?
- Describing workflows as directed acyclic graphs (DAGs)
- Workflow execution via DAGMan (DAG Manager)
- Node-level options in a DAG
- Modular organization of DAG components
- DAG-level control
- Additional DAGMan Features

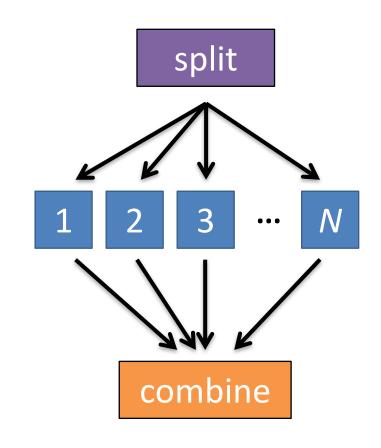

Why Workflows? Why "DAGs"?

Automation!

 Objective: Submit jobs in a particular order, automatically.

 Especially if: Need to reproduce the same workflow multiple times.

HTCondor Week 2018 4

DAG = "directed acyclic graph"

- topological ordering of vertices ("nodes") is established by directional connections ("edges")
- "acyclic" aspect requires a start and end, with no looped repetition
 - can contain cyclic subcomponents, covered in later slides for workflows

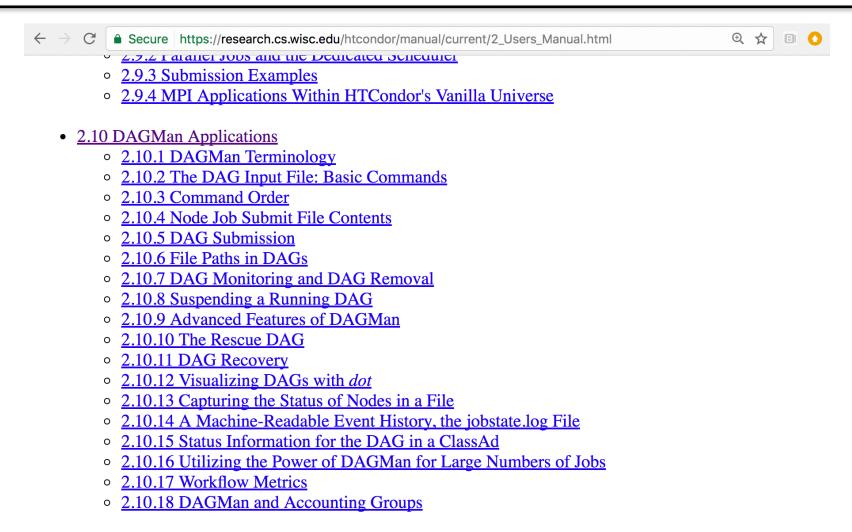

Wikimedia Commons

wikipedia.org/wiki/Directed acyclic graph

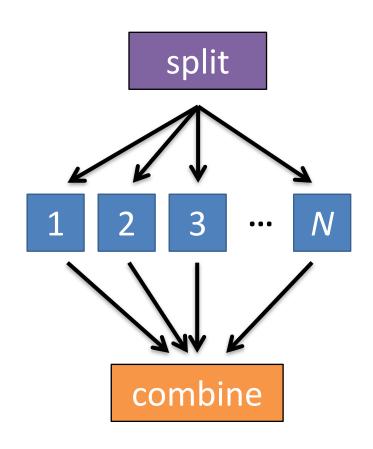

Describing Workflows with DAGMan

DAGMan in the HTCondor Manual

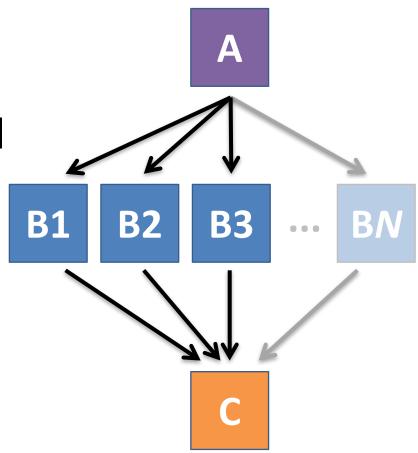

An Example HTC Workflow

 User must communicate the "nodes" and directional "edges" of the DAG

Simple Example for this Tutorial

 The DAG input file communicates the "nodes" and directional "edges" of the DAG

Simple Example for this Tutorial

 The DAG input file communicates the "nodes" and directional "edges" of the DAG

Look for links on future slides

Basic DAG input file: JOB nodes, PARENT-CHILD edges

my.dag

JOB A A.sub
JOB B1 B1.sub
JOB B2 B2.sub
JOB B3 B3.sub
JOB C C.sub
PARENT A CHILD B1 B2 B3
PARENT B1 B2 B3 CHILD C

B1 B2 B3

 Node names are used by various DAG features to modify their execution by DAG Manager.

Basic DAG input file: JOB nodes, PARENT-CHILD edges

my.dag

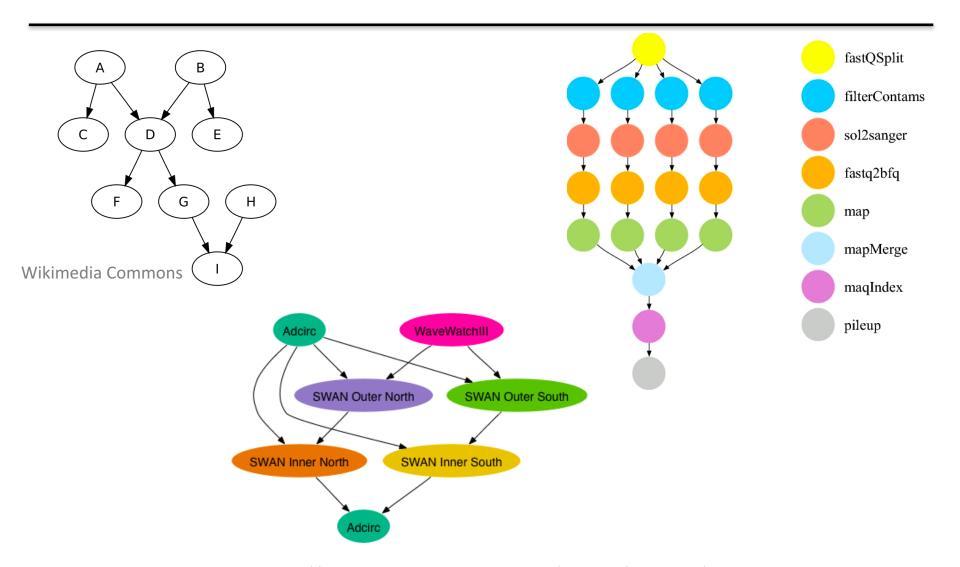

```
JOB A A.sub
JOB B1 B1.sub
JOB B2 B2.sub
JOB B3 B3.sub
JOB C C.sub
PARENT A CHILD B1 B2 B3
PARENT B1 B2 B3 CHILD C
```

(dag_dir)/

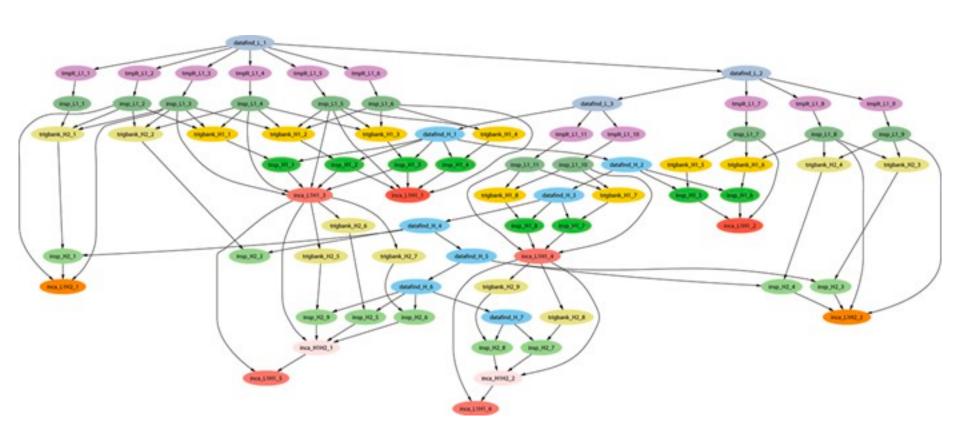

```
A.sub B1.sub
B2.sub B3.sub
C.sub my.dag
(other job files)
```

- Node names and filenames can be anything.
- Node name and submit filename do not have to match.

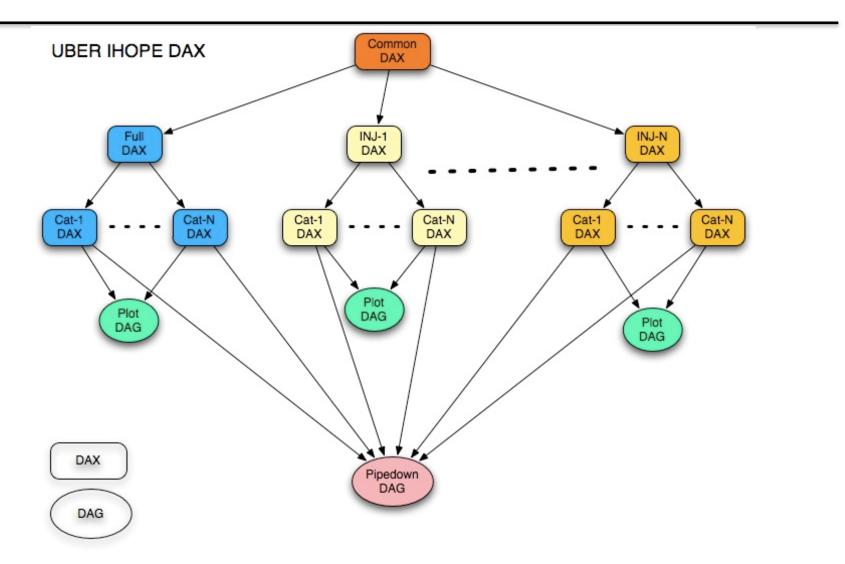

Endless Workflow Possibilities

Endless Workflow Possibilities

Repeating DAG Components!!

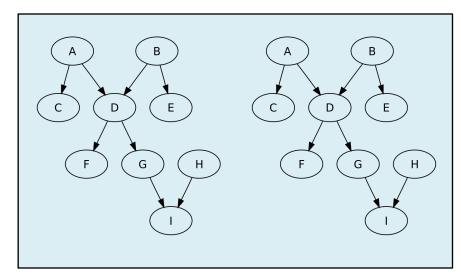

DAGs are also useful for non-sequential work

'bag' of HTC jobs

B1 B2 B3 ... BN

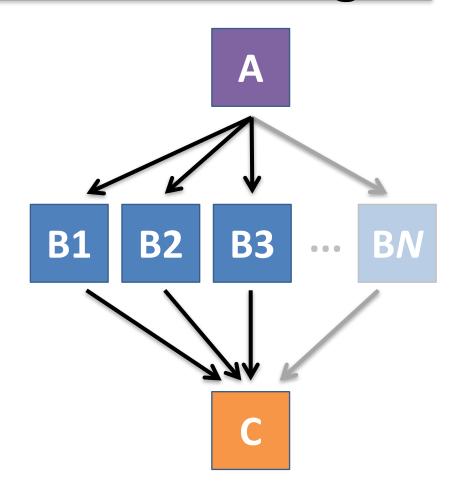

disjointed workflows

Basic DAG input file: JOB nodes, PARENT-CHILD edges

my.dag

JOB A A.sub
JOB B1 B1.sub
JOB B2 B2.sub
JOB B3 B3.sub
JOB C C.sub
PARENT A CHILD B1 B2 B3
PARENT B1 B2 B3 CHILD C

Submitting and Monitoring a DAGMan Workflow

Submitting a DAG to the queue

Submission command:

condor_submit_dag dag_file

```
$ condor_submit_dag my.dag

File for submitting this DAG to HTCondor : my.dag.condor.sub
Log of DAGMan debugging messages : my.dag.dagman.out
Log of HTCondor library output : my.dag.lib.out
Log of HTCondor library error messages : my.dag.lib.err
Log of the life of condor_dagman itself : my.dag.dagman.log

Submitting job(s).

1 job(s) submitted to cluster 87274940.
```

A submitted DAG creates and DAGMan job process in the queue

- DAGMan runs on the submit server, as a job in the queue
- At first:

```
$ condor_q
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
OWNER BATCH NAME SUBMITTED DONE
                                        RUN
                                                   TOTAL
                                                         JOB IDS
                                             IDLE
alice my.dag+128 4/30 18:08
                                                          0.0
1 jobs; 0 completed, 0 removed, 0 idle, 1 running, 0 held, 0 suspended
$ condor_q -nobatch
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
               SUBMITTED RUN TIME ST PRI SIZE CMD
ID
       OWNER
128.0 alice 4/30 18:08 0+00:00:06 R 0 0.3 condor dagman
1 jobs; 0 completed, 0 removed, 0 idle, 1 running, 0 held, 0 suspended
```

Jobs are automatically submitted by the DAGMan job

Seconds later, node A is submitted:

Jobs are automatically submitted by the DAGMan job

After A completes, B1-3 are submitted

```
$ condor_q
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
OWNER
      BATCH NAME SUBMITTED DONE RUN IDLE TOTAL JOB IDS
alice my.dag+128 4/30 18:08 1 3 5 130.0 ... 132.0
4 jobs; 0 completed, 0 removed, 3 idle, 1 running, 0 held, 0 suspended
$ condor_q -nobatch
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
       OWNER SUBMITTED
                           RUN TIME ST PRI SIZE CMD
ID
128.0 alice 4/30 18:08 0+00:20:36 R 0 0.3 condor dagman
130.0 alice 4/30 18:28 0+00:00:00 I 0 0.3 B run.sh
131.0 alice 4/30 18:28 0+00:00:00 I 0 0.3 B run.sh
132.0 alice 4/30 18:28 0+00:00:00 I 0 0.3 B run.sh
4 jobs; 0 completed, 0 removed, 3 idle, 1 running, 0 held, 0 suspended
```

Jobs are automatically submitted by the DAGMan job

After B1-3 complete, node C is submitted

```
$ condor_q
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
OWNER BATCH_NAME SUBMITTED DONE RUN IDLE TOTAL JOB_IDS
alice my.dag+128 4/30 18:08 4 _ 1 5 133.0
2 jobs; 0 completed, 0 removed, 1 idle, 1 running, 0 held, 0 suspended
$ condor_q -nobatch
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
ID OWNER SUBMITTED RUN_TIME ST PRI SIZE CMD
128.0 alice 4/30 18:08 0+00:46:36 R 0 0.3 condor_dagman
133.0 alice 4/30 18:54 0+00:00:00 I 0 0.3 C_combine.sh
2 jobs; 0 completed, 0 removed, 1 idle, 1 running, 0 held, 0 suspended</pre>
```

Status files are Created at the time of DAG submission

(dag_dir)/

```
A.sub B1.sub B2.sub
B3.sub C.sub (other job files)
my.dag my.dag.condor.sub my.dag.dagman.log
my.dag.dagman.out my.dag.lib.err my.dag.lib.out
my.dag.nodes.log
```

- *.condor.sub and *.dagman.log describe the queued DAGMan job process, as for all queued jobs
- *.dagman.out has detailed logging (look to first for errors)
- *.lib.err/out contain std err/out for the DAGMan job process
- *.nodes.log is a combined log of all jobs within the DAG

Removing a DAG from the queue

 Remove the DAGMan job in order to stop and remove the entire DAG:

condor_rm dagman_jobID

```
$ condor_q
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
OWNER BATCH_NAME SUBMITTED DONE RUN IDLE TOTAL JOB_IDS
alice my.dag+128 4/30 18:08 4 1 6 133.0
2 jobs; 0 completed, 0 removed, 1 idle, 1 running, 0 held, 0 suspended
$ condor_rm 128
All jobs in cluster 128 have been marked for removal</pre>
```

 Creates a rescue file so that only incomplete or unsuccessful NODES are repeated upon resubmission

DAGMan > DAG Monitoring and DAG Removal DAGMan > The Rescue DAG

Removal of a DAG results in a rescue file

```
(dag_dir)/
```

```
A.sub B1.sub B2.sub B3.sub C.sub (other job files)
my.dag my.dag.condor.sub my.dag.dagman.log
my.dag.dagman.out my.dag.lib.err my.dag.lib.out
my.dag.metrics my.dag.nodes.log my.dag.rescue001
```

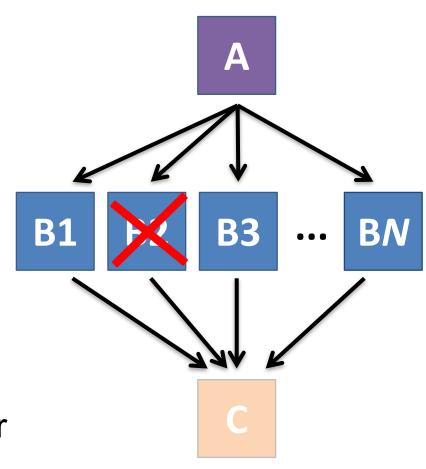

- Named dag_file.rescue001
 - increments if more rescue DAG files are created
- Records which NODES have completed successfully
 - does not contain the actual DAG structure

Rescue Files For Resuming a Failed DAG

- A rescue file is created any time a DAG is removed from the queue by the user (condor_rm) or automatically:
 - a node fails, and after DAGMan advances through any other possible nodes
 - the DAG is aborted (covered later)
 - the DAG is halted and not unhalted (covered later)
- The rescue file will be used (if it exists) when the original DAG file is resubmitted
 - Override: condor_submit_dag dag_file -f

Node Failures Result in DAG Failure and Removal

- If a node JOB fails (non-zero exit code)
 - DAGMan continues to run other JOB nodes until it can no longer make progress
- Example at right:
 - B2 fails
 - Other B* jobs continue
 - DAG fails and exits after
 B* and before node C

Resolving held node jobs

```
$ condor_q -nobatch
-- Schedd: submit-3.chtc.wisc.edu : <128.104.100.44:9618?...
ID OWNER SUBMITTED RUN_TIME ST PRI SIZE CMD

128.0 alice 4/30 18:08 0+00:20:36 R 0 0.3 condor_dagman

130.0 alice 4/30 18:18 0+00:00:00 H 0 0.3 B_run.sh

131.0 alice 4/30 18:18 0+00:00:00 H 0 0.3 B_run.sh

132.0 alice 4/30 18:18 0+00:00:00 H 0 0.3 B_run.sh

4 jobs; 0 completed, 0 removed, 0 idle, 1 running, 3 held, 0 suspended
```

- Look at the hold reason (in the job log, or with 'condor q -hold')
- Fix the issue and release the jobs (condor_release)
 -OR- remove the entire DAG, resolve, then resubmit the DAG

DAG Completion

```
(dag_dir)/
```

```
A.sub B1.sub B2.sub
B3.sub C.sub (other job files)
my.dag my.dag.condor.sub my.dag.dagman.log
my.dag.dagman.out my.dag.lib.err my.dag.lib.out
my.dag.nodes.log my.dag.dagman.metrics
```

- *.dagman.metrics is a summary of events and outcomes
- *.dagman.log will note the completion of the DAGMan job
- *.dagman.out has detailed logging for all jobs (look to first for errors)

Beyond the Basic DAG: Node-level Modifiers

Default File Organization

my.dag

```
JOB A A.sub
JOB B1 B1.sub
JOB B2 B2.sub
JOB B3 B3.sub
JOB C C.sub
PARENT A CHILD B1 B2 B3
PARENT B1 B2 B3 CHILD C
```

```
(dag_dir)/
```

```
A.sub B1.sub
B2.sub B3.sub
C.sub my.dag
(other job files)
```

 What if you want to organize files in other directories?

Node-specific File Organization with DIR

DIR sets the submission directory of the node

my.dag

```
JOB A A.sub DIR A

JOB B1 B1.sub DIR B

JOB B2 B2.sub DIR B

JOB B3 B3.sub DIR B

JOB C C.sub DIR C

PARENT A CHILD B1 B2 B3

PARENT B1 B2 B3 CHILD C
```

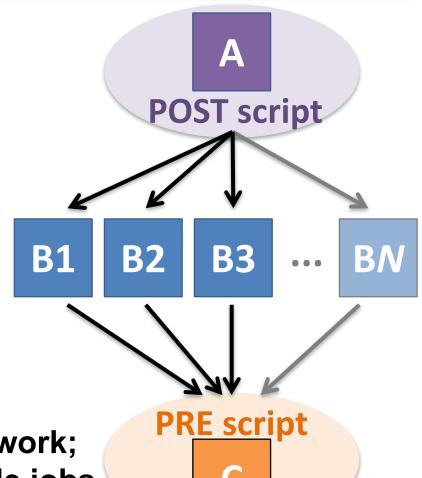

(dag_dir)/

```
my.dag
A/ A.sub (A job files)
B/ B1.sub B2.sub
B3.sub (B job files)
C/ C.sub (C job files)
```

PRE and POST scripts run on the submit server, as part of the node

```
my.dag
```

```
JOB A A.sub
SCRIPT POST A sort.sh
JOB B1 B1.sub
JOB B2 B2.sub
JOB B3 B3.sub
JOB C C.sub
SCRIPT PRE C tar it.sh
PARENT A CHILD B1 B2 B3
PARENT B1 B2 B3 CHILD C
```

 Use sparingly for lightweight work; otherwise include work in node jobs

RETRY failed nodes to overcome transient errors

 Retry a node up to N times if it fails (the job exit code is non-zero):

RETRY node name N

Example:

```
JOB A A.sub
RETRY A 5
JOB B B.sub
PARENT A CHILD B
```

- See also: retry except for a particular exit code (UNLESS-EXIT)
- Note: max_retries in the submit file are preferable for simple cases

RETRY applies to whole node, including PRE/POST scripts

- PRE and POST scripts are included in retries
- RETRY of a node with a POST script uses the exit code from the POST script (not from the job)
 - POST script can do more to determine node success, perhaps by examining JOB output

Example:

```
SCRIPT PRE A download.sh
JOB A A.sub
SCRIPT POST A checkA.sh
RETRY A 5
```

SCRIPT Arguments and Argument Variables

JOB A A.sub SCRIPT POST A checkA.sh my.out \$RETURN RETRY A 5

\$JOB: node name

\$JOBID: cluster.proc

\$RETURN: exit code of the node

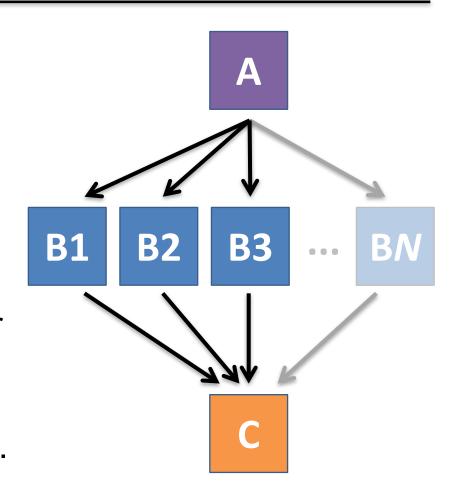

\$PRE_SCRIPT_RETURN: exit code of PRE script

\$RETRY: current retry count

(more variables described in the manual)

Best Control Achieved with One Process per JOB Node

- While submit files can 'queue' many processes, a single process per submit file is usually best for DAG JOBs
 - Failure of any process in a JOB node results in failure of the entire node and immediate removal of other processes in the node.
 - RETRY of a JOB node retries the entire submit file.

Modular Organization and Control of DAG Components

HTCondor Week 2018

Submit File Templates via VARS

 VARS line defines node-specific values that are passed into submit file variables

```
VARS node_name var1="value" [var2="value"]
```

 Allows a single submit file shared by all B jobs, rather than one submit file for each JOB.

my.dag

```
JOB B1 B.sub

VARS B1 data="B1" opt="10"

JOB B2 B.sub

VARS B2 data="B2" opt="12"

JOB B3 B.sub

VARS B3 data="B3" opt="14"
```

B.sub

```
...
InitialDir = $(data)
arguments = $(data).csv $(opt)
...
queue
```

SPLICE groups of nodes to simplify lengthy DAG files

my.dag

```
JOB A A.sub

SPLICE B B.spl

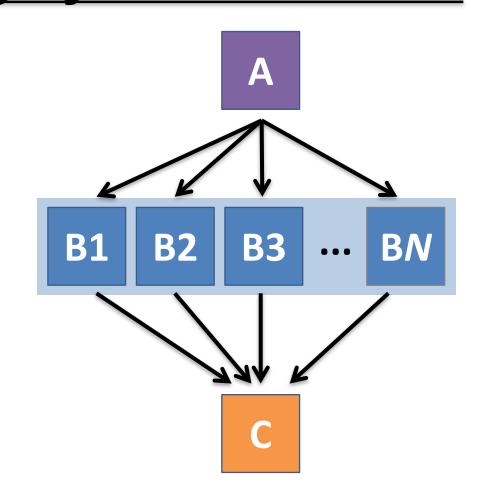

JOB C C.sub

PARENT A CHILD B

PARENT B CHILD C
```

B.spl

```
JOB B1 B1.sub
JOB B2 B2.sub
...
JOB BN BN.sub
```

Use nested SPLICEs with DIR for repeating workflow components

my.dag

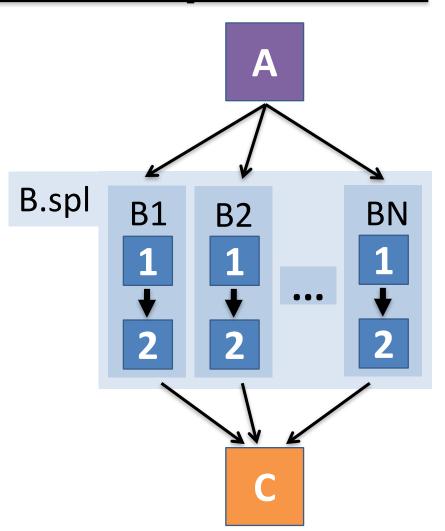

```
JOB A A.sub DTR A
SPLICE B B.spl DIR B
JOB C C. sub DIR C
PARENT A CHILD B
PARENT B CHILD C
```

B.spl

```
SPLICE B1 ../inner.spl DIR B1
SPLICE B2 ../inner.spl DIR B2
SPLICE BN .../inner.spl DIR BN
```

inner.spl

```
JOB 1 ../1.sub
JOB 2 ../2.sub
PARENT 1 CHILD 2
```

Use nested SPLICEs with DIR for repeating workflow components

my.daq

```
JOB A A.sub DTR A
SPLICE B B.spl DIR B
JOB C C. sub DIR C
PARENT A CHILD B
PARENT B CHILD C
```

B.spl

```
SPLICE B1 ../inner.spl DIR B1
SPLICE B2 ../inner.spl DIR B2
SPLICE BN ../inner.spl DIR BN
```

inner.spl

```
JOB 1 ../1.sub
JOB 2 ../2.sub
PARENT 1 CHILD 2
```

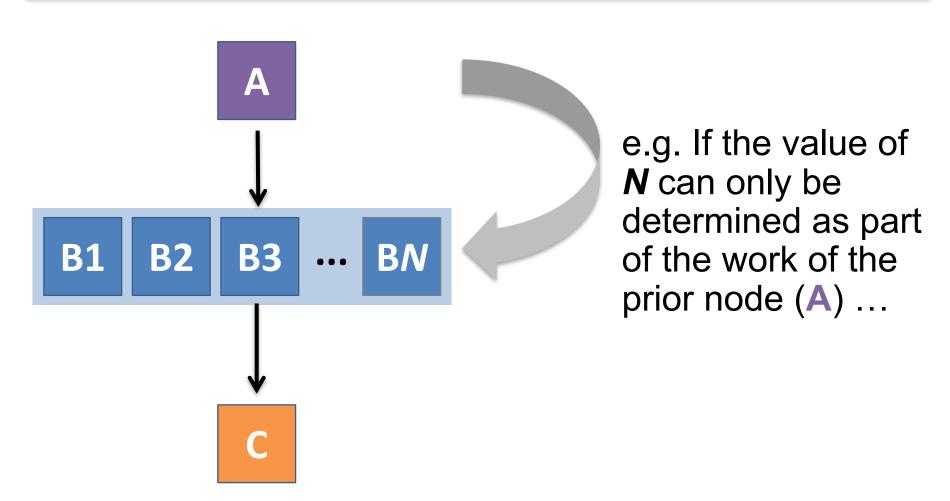

(dag dir)/

```
my.dag
A/ A.sub (A job files)
B/ B.spl inner.spl
   1.sub 2.sub
   B1/ (1-2 job files)
   B2/ (1-2 job files)
   BN/ (1-2 \text{ job files})
C/ C.sub (C job files)
```

More on SPLICE Behavior

- HTCondor takes in a DAG and its SPLICEs as a single, large DAG file.
 - SPLICEs simply allow the user to simplify and modularize the DAG expression using separate files
 - A single DAGMan job is queued with single set of status files.
- Great for gradually testing and building up a large DAG (since a SPLICE file can be submitted by itself, without its outer DAG).
- SPLICE lines are not treated like nodes.
 - no PRE/POST scripts or RETRIES

What if some DAG components can't be known at submit time?

A SUBDAG within a DAG

my.dag

JOB A A.sub

SUBDAG EXTERNAL B B.dag

JOB C C.sub

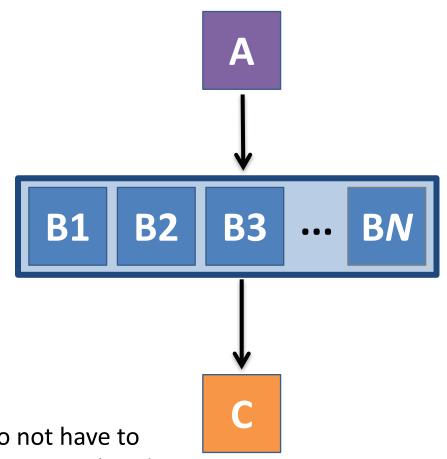

PARENT A CHILD B

PARENT B CHILD C

B.dag (written by **A**)

JOB B1 B1.sub JOB B2 B2.sub JOB BN BN sub

A SUBDAG is not submitted (so contents do not have to exist) until prior nodes in the outer DAG have completed.

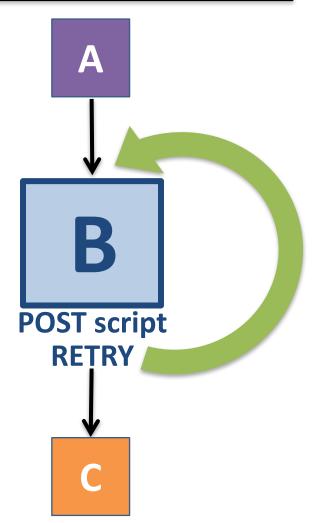

Use a SUBDAG to achieve Cyclic Components within a DAG

- POST script determines whether another iteration is necessary; if so, exits non-zero
- RETRY applies to entire SUBDAG, which may include multiple, sequential nodes

my.dag

JOB A A.sub SUBDAG EXTERNAL B B.dag SCRIPT POST B iterateB.sh RETRY B 100 JOB C C.sub PARENT A CHILD B PARENT B CHILD C

More on SUBDAG Behavior

- Each SUBDAG EXTERNAL is a DAGMan job running in the queue, and too many can overwhelm the queue.
 - WARNING: SUBDAGs should only be used (rather than SPLICES) when absolutely necessary!
- SUBDAGs are nodes (can have PRE/POST scripts, retries, etc.)

DAG-level Control

Pause (then resume) a DAG by holding it

Hold the DAGMan job process:

```
condor_hold dagman_jobID
```

- Pauses the DAG
 - No new node jobs submitted
 - Queued node jobs continue to run (including SUBDAGs), but no PRE/POST scripts
 - DAG resumes when released
 (condor_release dagman_jobID)

Cleanly quit a DAG with a halt file

- Create a file named <u>DAG_file.halt</u> in the same directory as the submitted DAG file
- Allows the DAG to complete nodes in-progress
 - No new node jobs submitted
 - Queued node jobs, SUBDAGs, and POST scripts continue to run, but not PRE scripts
- DAGMan resumes after the file is deleted
 - If not deleted, the DAG creates a rescue DAG file and exits after all queued jobs have completed

Throttle job nodes of large DAGs via DAG-level configuration

- If a DAG has many (thousands or more) jobs, submit server and queue performance can be assured by limiting:
 - Number of jobs in the queue
 - Number of jobs idle (waiting to run)
 - Number of PRE or POST scripts running
- Limits can be specified in a DAG-specific **CONFIG** file (recommended) or as arguments to condor submit dag

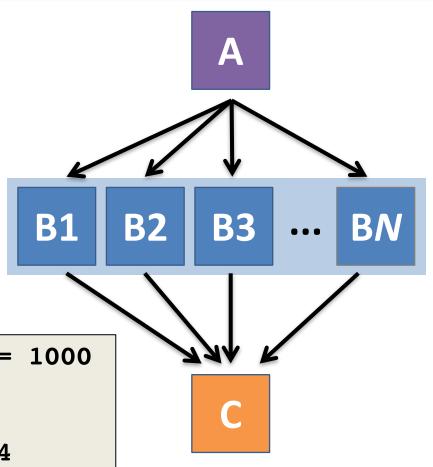

DAG-specific throttling via a **CONFIG** file

my.daq

JOB A A.sub SPLICE B B.dag JOB C C.sub PARENT A CHILD B PARENT B CHILD C CONFIG my.dag.config

my.dag.config

DAGMAN_MAX_JOBS_SUBMITTED = 1000 DAGMAN_MAX_JOBS_IDLE = 100 DAGMAN MAX PRE SCRIPTS = 4 DAGMAN MAX POST SCRIPTS = 4

Other DAGMan Features

Other DAGMan Features: Node-Level Controls

Set the **PRIORITY** of JOB nodes with:

```
PRIORITY node_name priority_value
```

 Use a PRE_SKIP to skip a node and mark it as successful, if the PRE script exits with a specific exit code:

```
PRE_SKIP node_name exit_code
```

Other DAGMan Features: Modular Control

- Append NOOP to a JOB definition so that its JOB process isn't run by DAGMan
 - Test DAG structure without running jobs (node-level)
 - Simplify combinatorial PARENT-CHILD statements (modular)
- Communicate DAG features separately with INCLUDE
 - e.g. separate file for JOB nodes and for VARS definitions, as part of the same DAG
- Define a CATEGORY to throttle only a specific subset of jobs

<u>DAGMan Applications > The DAG Input File > JOB</u>

<u>DAGMan Applications > Advanced Features > INCLUDE</u>

<u>DAGMan Applications > Advanced > Throttling by Category</u>

Other DAGMan Features: DAG-Level Controls

- Replace the node_name with ALL_NODES to apply a DAG feature to all nodes of the DAG
- Abort the entire DAG if a specific node exits with a specific exit code:

```
ABORT-DAG-ON node name exit code
```

 Define a FINAL node that will always run, even in the event of DAG failure (to clean up, perhaps).

```
FINAL node_name submit_file
```

<u>DAGMan Applications > Advanced > ALL_NODES</u> <u>DAGMan Applications > Advanced > Stopping the Entire DAG</u> <u>DAGMan Applications > Advanced > FINAL Node</u>

Much More in the HTCondor Manual!!!

http://research.cs.wisc.edu/htcondor/manual/current/2_10DAGMan_Applications.html

FINAL QUESTIONS?

htcondor-users@cs.wisc.edu
