

# John P. Update 5/2/19

- Made progress on recreating Nicole's interference results.
- My result for isospin interference on operator 1 is roughly similar to hers
- My two operator interference results have some similar features but aren't quite the same.

# Isospin interference

• For isospin interference, I got destructive interference when

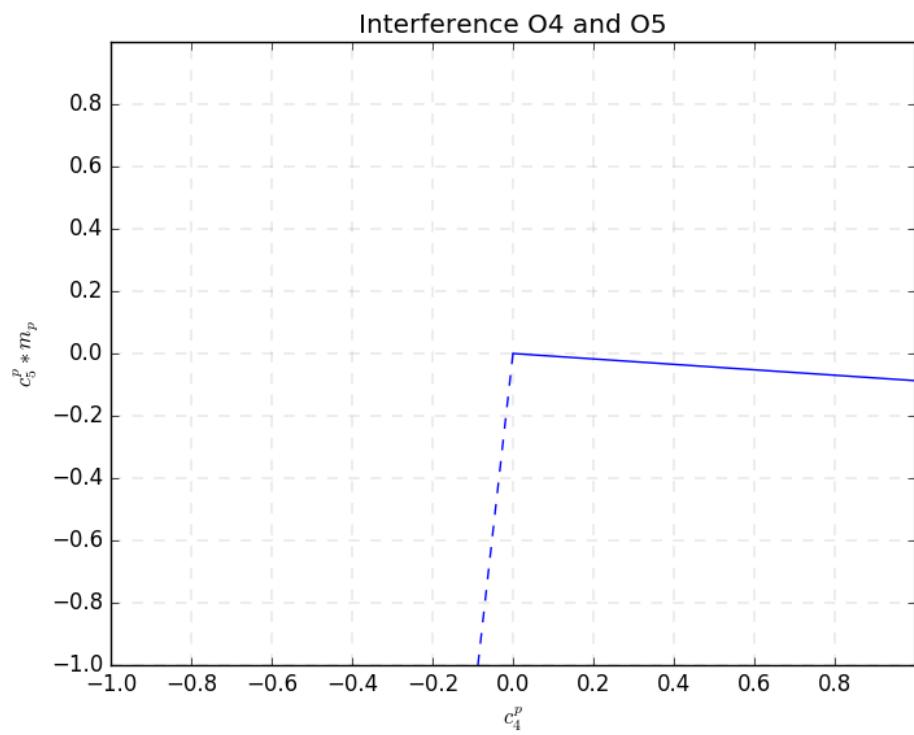

$$\frac{c_1^n}{c_1^p} = -0.77$$

• Nicole reports destructive interference when

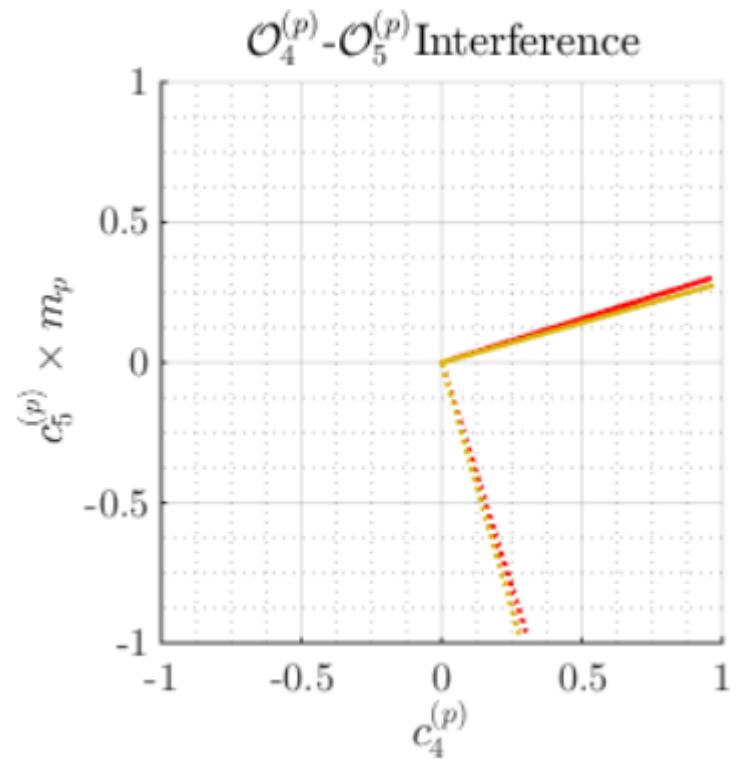

$$\frac{c_1^n}{c_1^p} = -0.74$$

# Two Operator interferences

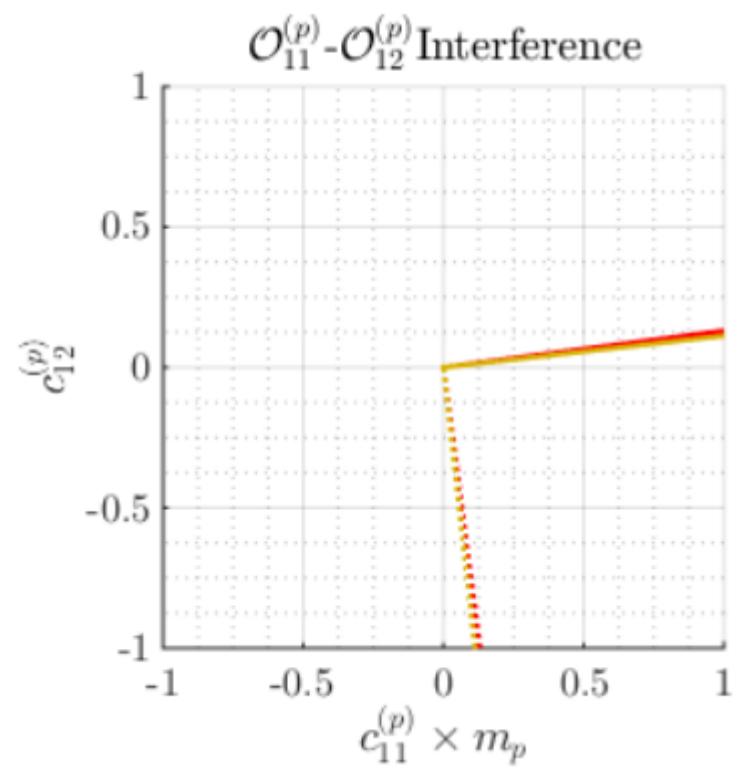

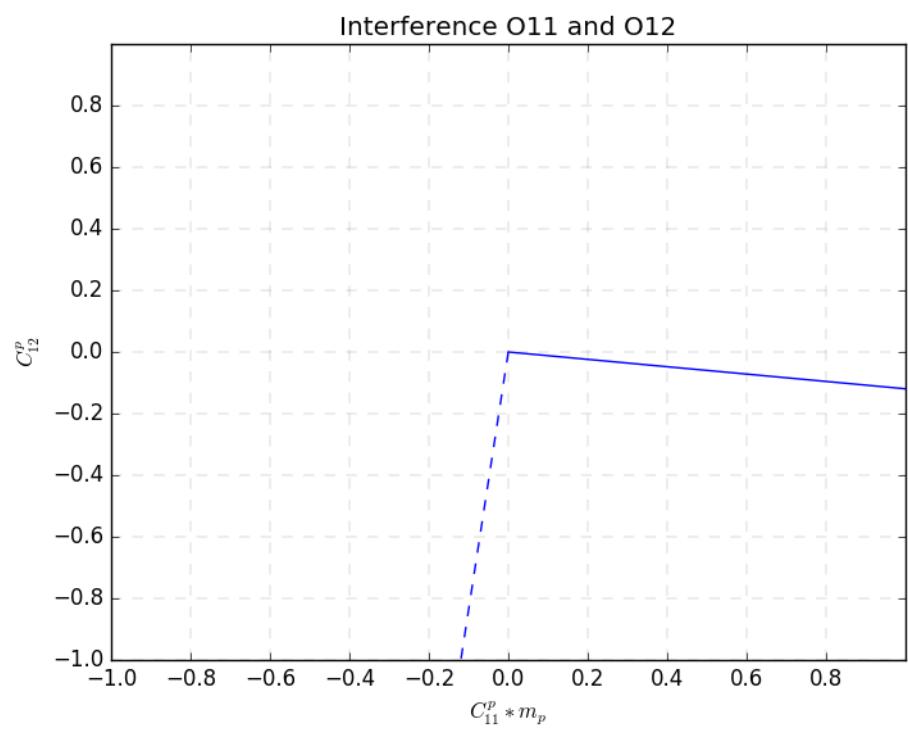

My result:

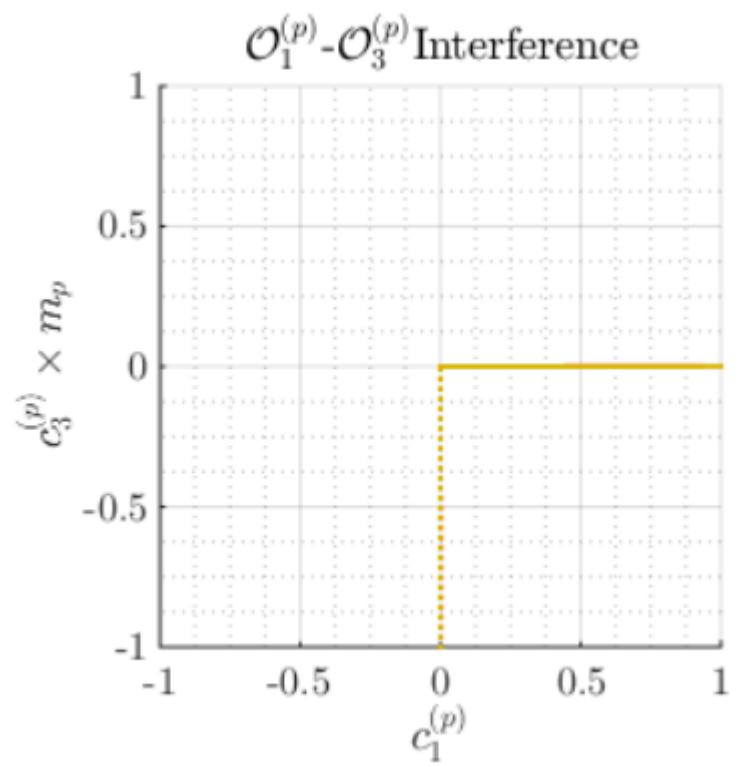

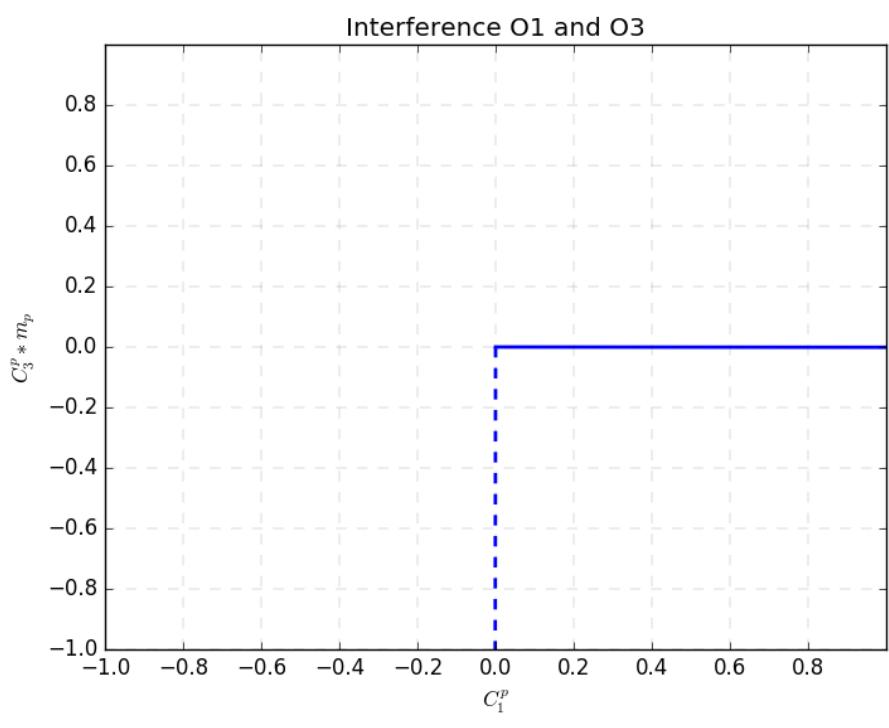

Nicole's result

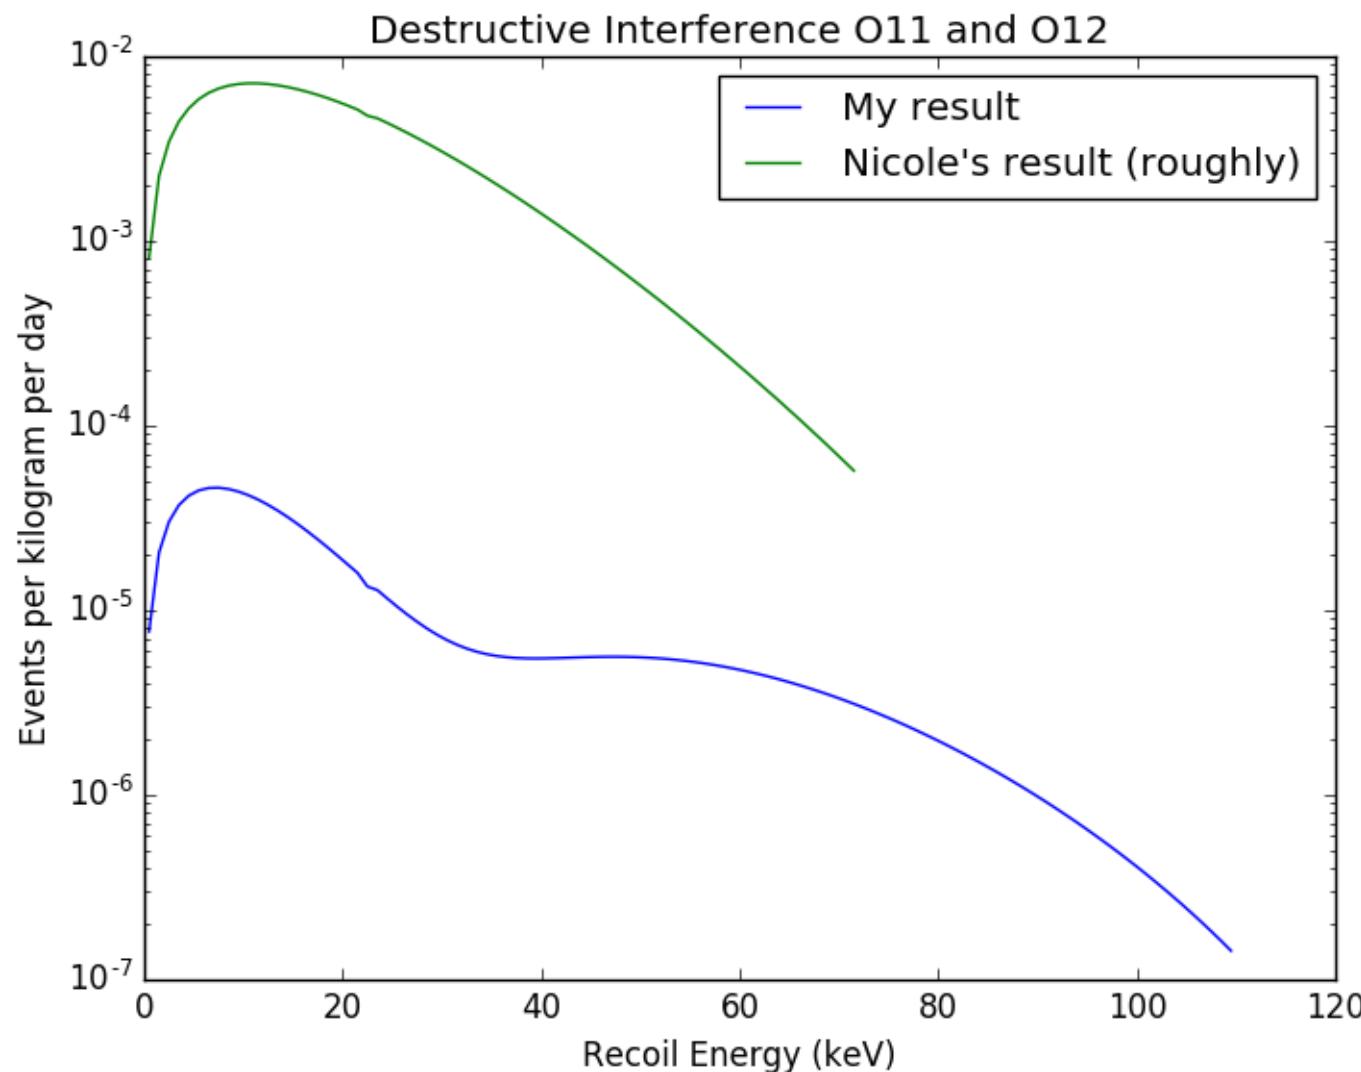

Dashed line indicates destructive interference. Solid indicates constructive  
On Nicole's plot, the yellow line gives the result for Xenon.

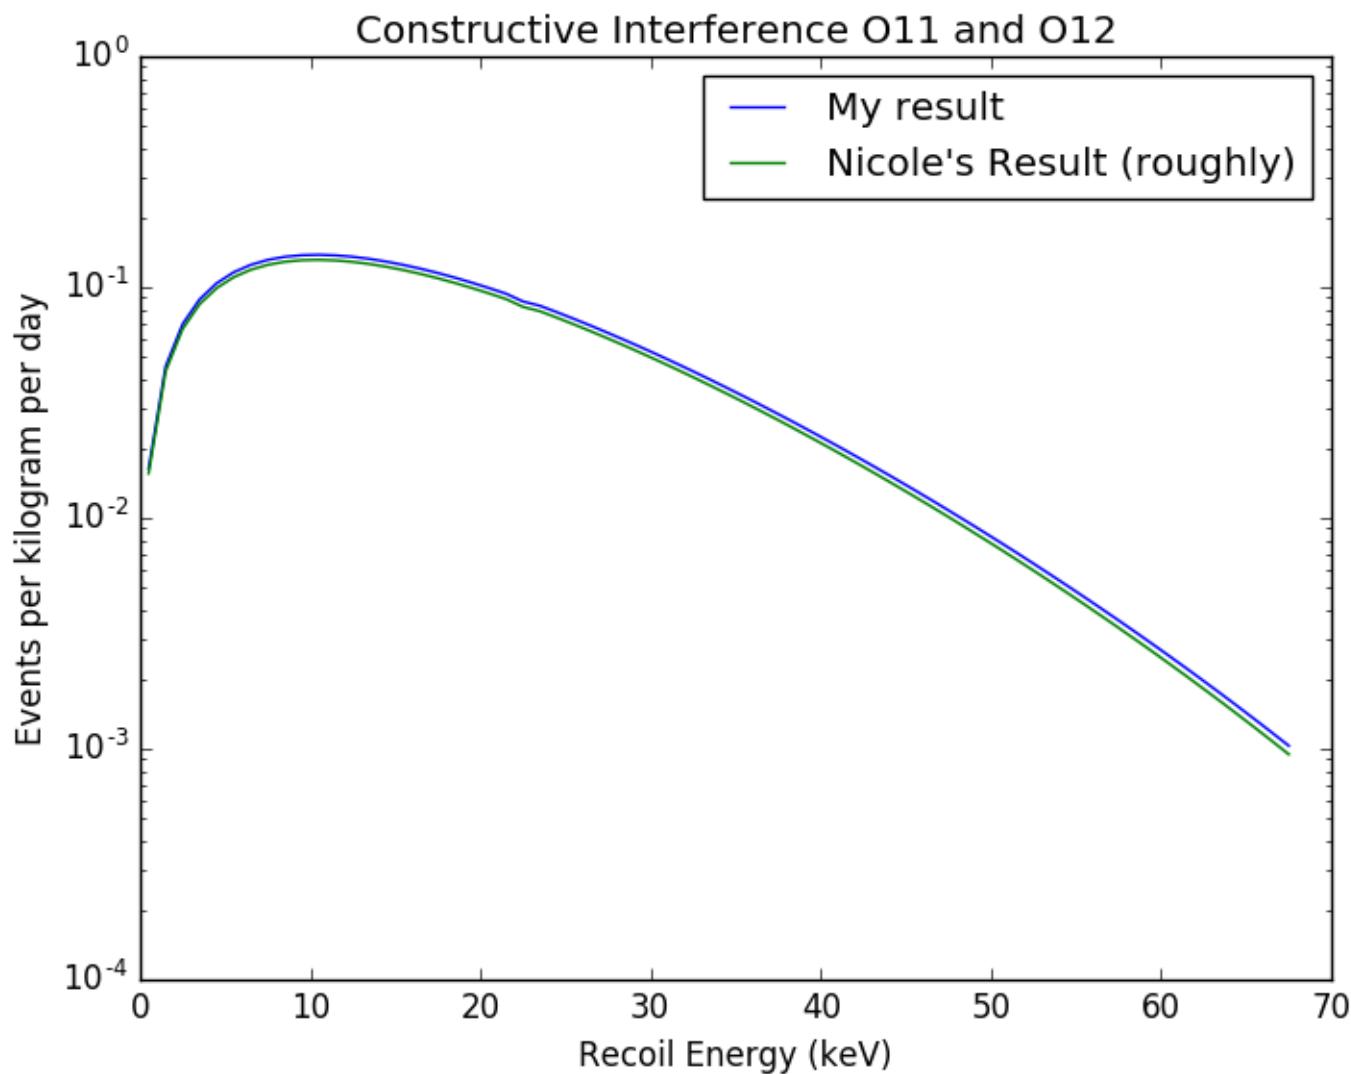

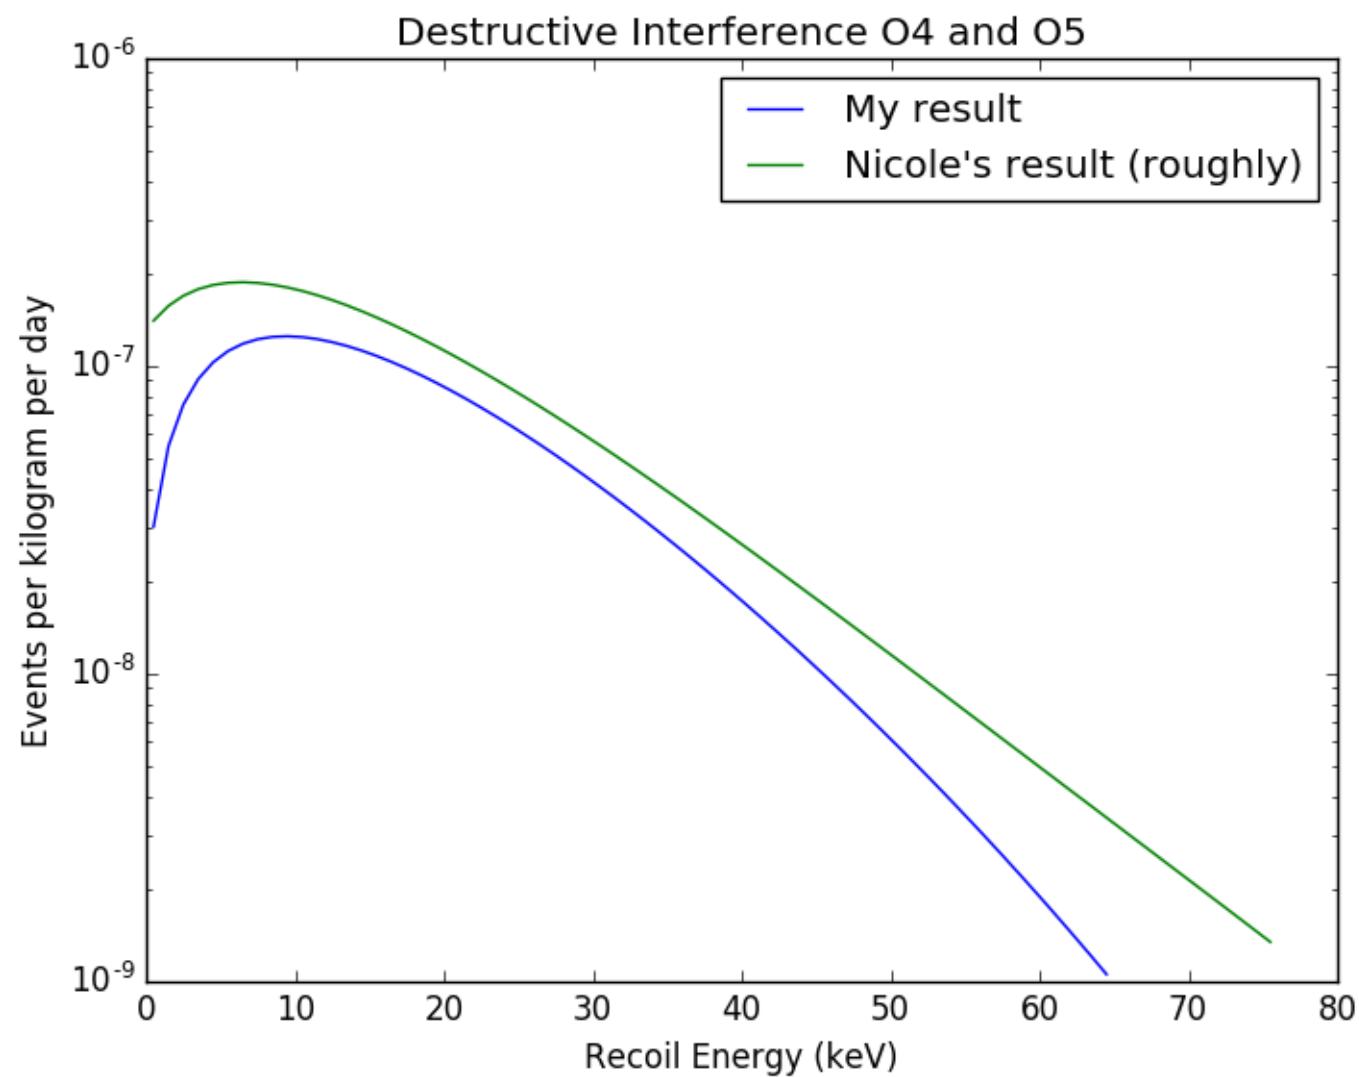

# Destructive interference comparison

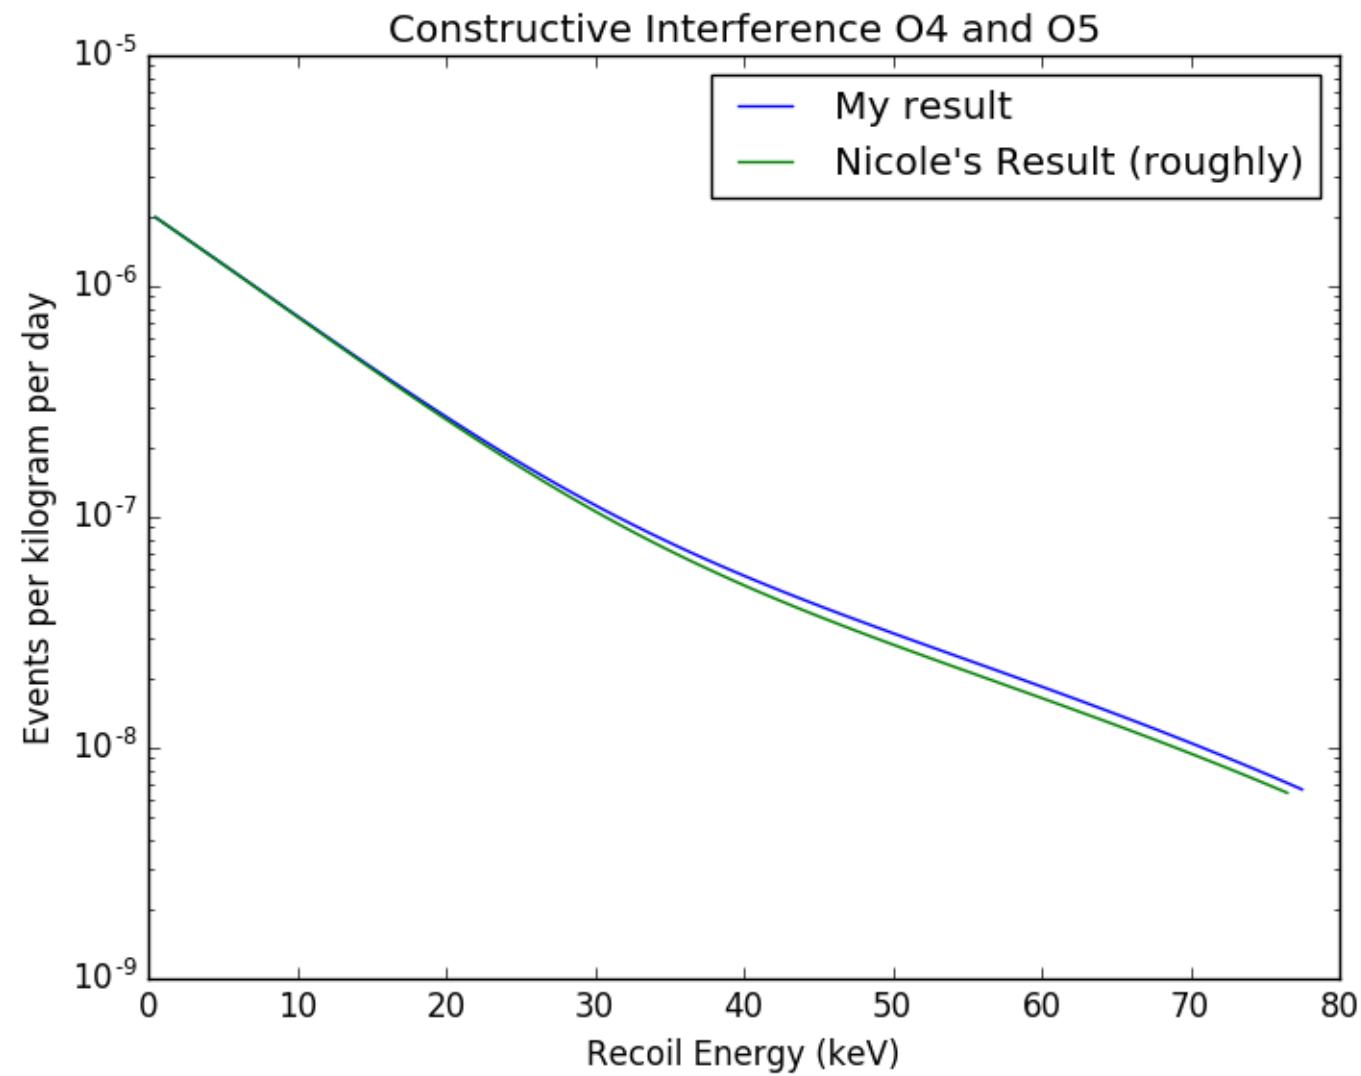

Note: These plots are for protons only, so no isospin interference involved.

# Constructive Interference

# Goals

- Short term: figure out why my results look different from Nicole's.
- Add spectrum without interference to each figure.
- Longer term:
  - Investigate coefficient combinations in between the maxima that Nicole found.
  - Run Shaun's code using Calvin's density matrices for Argon
