

DREAMWORKS

Farm Manager & HTCondor Services David Gardner

Who Are You?

David Gardner

- Sr. Software Engineer / Tech Lead
- JoSE Team (pictured in lower-right)
- Been at DWA 9 years
- Was at Jim Henson's Creature Shop for three years prior to DWA

HTCondor @ DreamWorks

- Started in 2010
- Launched on Madagascar 3
- 15 Features and counting...
- All Dag Submissions
- Typically 1-10k jobs per submission
- Multiple Schedds per production
- Typically 5-7 active productions

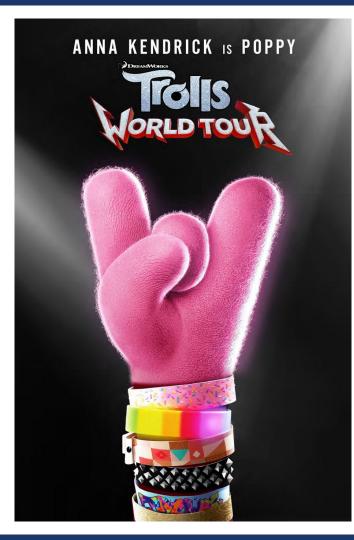

Quick Farm Stats

- 925 dedicated hosts
- +700 900 Desktops (night & weekends)
- 50k cores / 90k cores
- Typical Host:
 - 96 Cores & 188 GB

- 1:24:10 Runtime
- 10 million hours
- 252 million cpu-hours
- 36 million jobs
- 1.5 million submissions
- 20 Songs

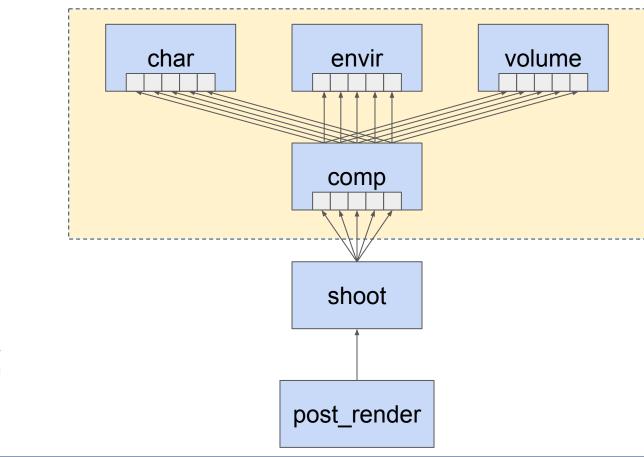

- Production / Sequence / Shot / Frame
- Shot is a unit of work
- 1,600 shots per production
- Typical shot is about 70-120 frames long (3-5s)
- 24 fps
- Jobs grouped into "Nodes"

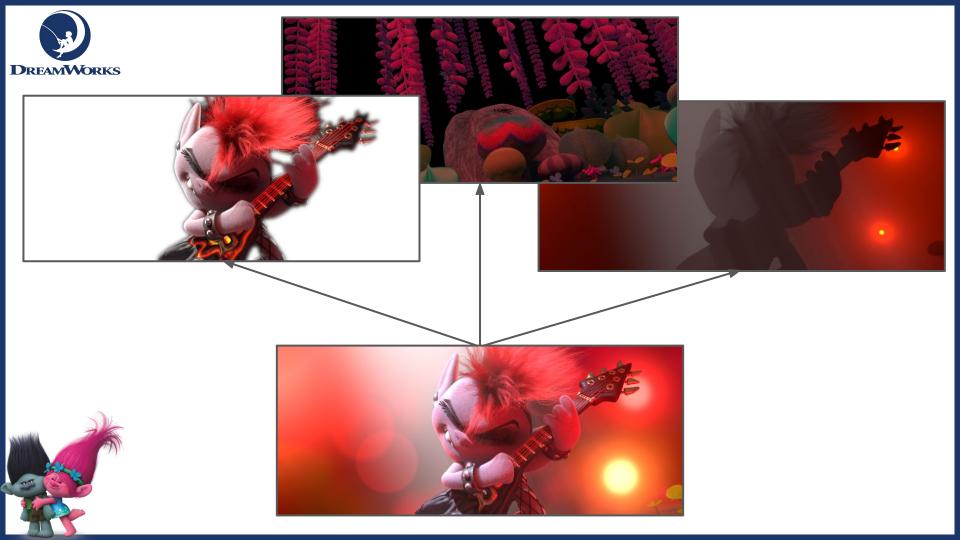

Typical DAG Submission

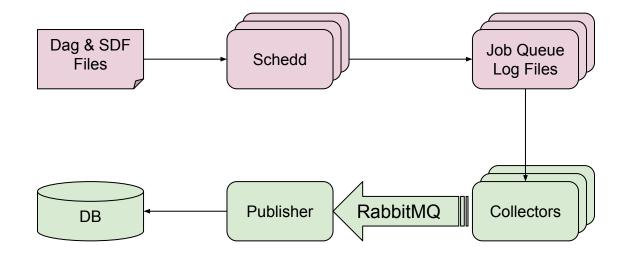

DREAMWORKS

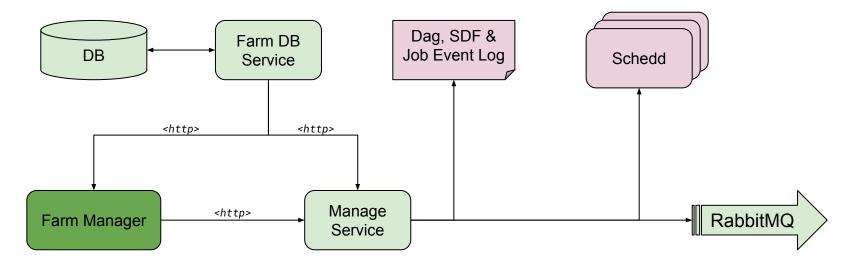

Collecting HTCondor Data

One Collector per Schedd

Rest Service & HTCondor Interaction

Farm DB Service

Pre-defined Queries

- By User
- Production, Department & Team
- Production, Sequence & Shot
- By Host
- All

Time Window Arguments

- Active Now
- 24 hours
- 3 days
- 7 days
- 30 days

Farm Manager

- Web application
- User customizable views
- Movie player & job log viewer
- Actively maintained since 2012
- Has cool logo

Farm Manager Opinionated Decisions

- Artists shouldn't need to use command line
- Artists should be largely unaware of HTCondor
- Support both needs of Ops teams & Artists
- Any time we have to run an HTCondor command

should become a new feature

• Must have a cool logo

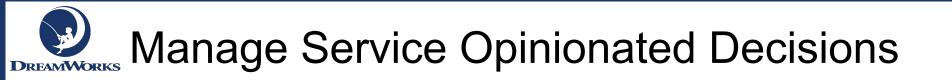

Manage Service

- REST Service for interacting with HTCondor & Dagman
- Fetches submission information from DB service
- Most operations require suspending the dagman job to prevent race conditions
- Original version made calls to condor_qedit, condor_rm ...
- New version makes use of HTCondor Python API

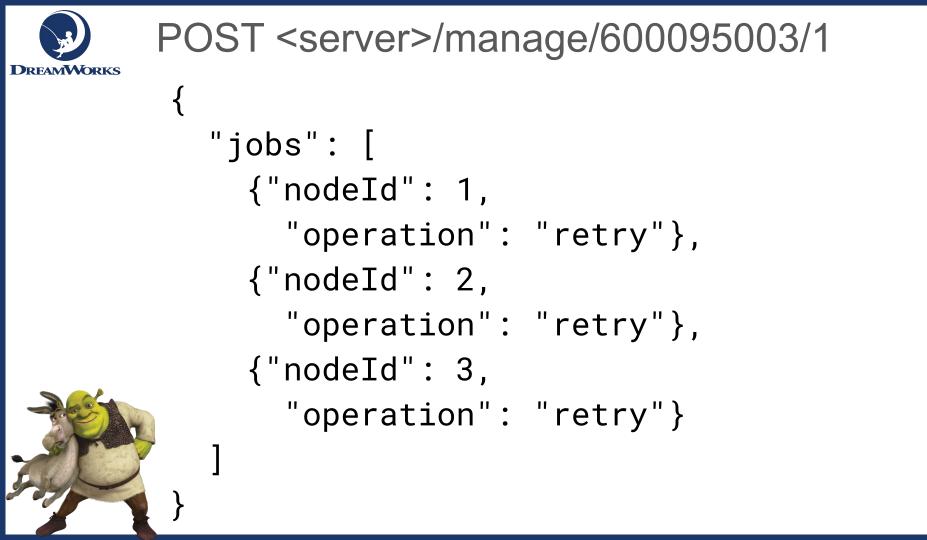

- Actions performed on both active job & unsubmitted jobs in dag transparently to users.
- All are either a "Modification" (classAd via condor_qedit) or an "Operation" (condor_rm, condor_vacate...)
- REST API based on submission, node & jobIds
- Classes named following DWA naming conventions (ie. retry not release).

POST <server>/manage/600095003/1

```
HTTP/1.1 200 OK
  "data": {
    "600095003.1.1": true,
    "600095003.1.2": true,
    "600095003.1.3": true},
  "error": {"errorCode": 0}
```

PUT <server>/manage/600095003/1/3

```
{"operation": "retry"}
```

```
HTTP/1.1 200 OK
```

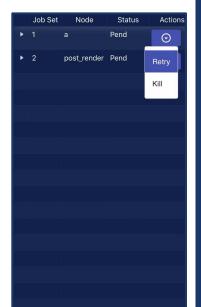

```
{
    "data": {"600095003.1.3": true},
    "error": {"errorCode": 0}
}
```

Future?
