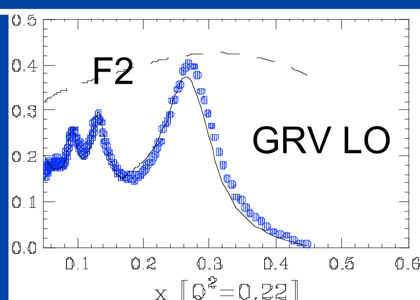
DIS 2005 Madison , April, 2005

Modeling on neutrino cross sections

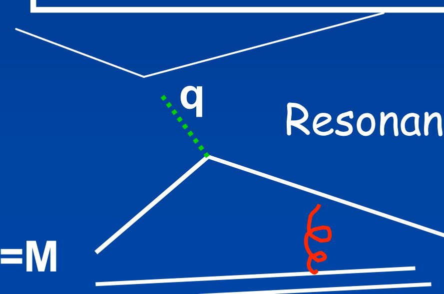
- Describe DIS, resonance, even photo- production (Q^2=0) in terms of quark-parton model. With PDFS, it is straightforward to convert charged-lepton scattering cross sections into neutrino cross section.
- Challenge:
  - Understanding of high x PDFs at very low Q^2?
  - Understanding of resonance scattering in terms of quark-parton model?



- NNLO QCD+TM approach

  good to explain non-pert. QCD effects at low Q^2
- Effective LO approach (pseudo NNLO: for MC)

  Use effective LO PDFs with a new scaling variable, ξw to absorb target mass, higher twist, missing higher orders



Resonance, higher twist, and TM

P=M

m_f=M*
(final state interaction)

$$\xi_W = \frac{Q^2 + m_f^2 + O(m_f^2 - m_i^2) + A}{M\nu\,(1+(1+Q^2/\nu^2))^{1/2} + B} \longrightarrow X_{bj} = Q^2/2M\nu$$

Effective LO model - 2003

1. Start with GRV98 LO (Q^2_{min}=0.80 GeV^2)

 - dashed line- describe F2 data at high Q^2

2. Replace the Xbj with a new scaling, ξ_w

3. Multiply all PDFs by K factors for photo prod. limit and higher twist

 $[\ \sigma(\gamma)= 4\pi\alpha/Q^2 * F_2(x, Q^2)\ ]$

 Ksea = $Q^2/[Q^2+Csea]$

 Kval = $[1- G_D{}^2 (Q^2)\ ]$

 $*[Q^2+C2V] / [Q^2+C1V]$ motivated by Adler Sum rule

 where $G_D{}^2 (Q^2) = 1/ [\ 1+Q^2 / 0.71\ ]^4$

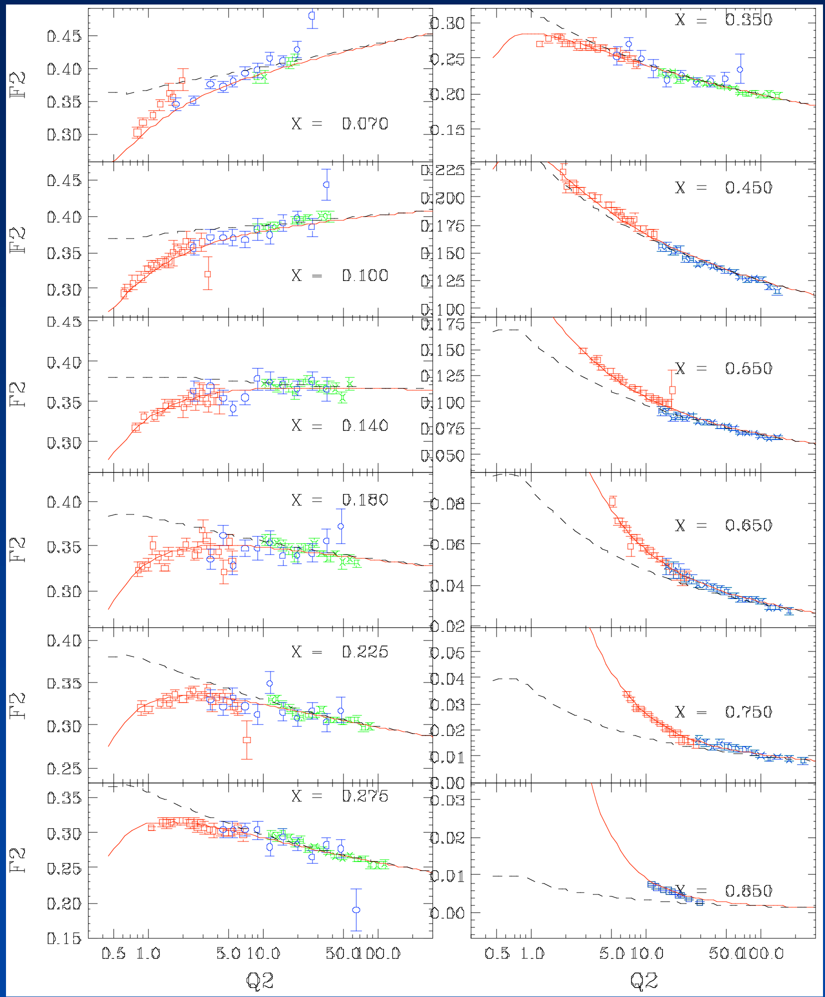
4. Freeze the evolution at $Q^2 = Q^2_{min}$

 - $F_2(x, Q^2 < 0.8) = K(Q^2)^* F_2(Xw, Q^2=0.8)$

- Fit to all DIS F2 P/D (with low x HERA data)
 A=0.418, B=0.222

 Csea = 0.381,C1V = 0.604, C2V= 0.485

 χ^2/DOF = 1268 / 1200 Solid Line



A : initial binding/TM effect+ higher order

B : final state mass m_f^2, Δm^2,

K Factor: Photo-prod limit (Q^2 =0), Adler sum rule

F_2(d) resonance low Q2

Photo-production (d)

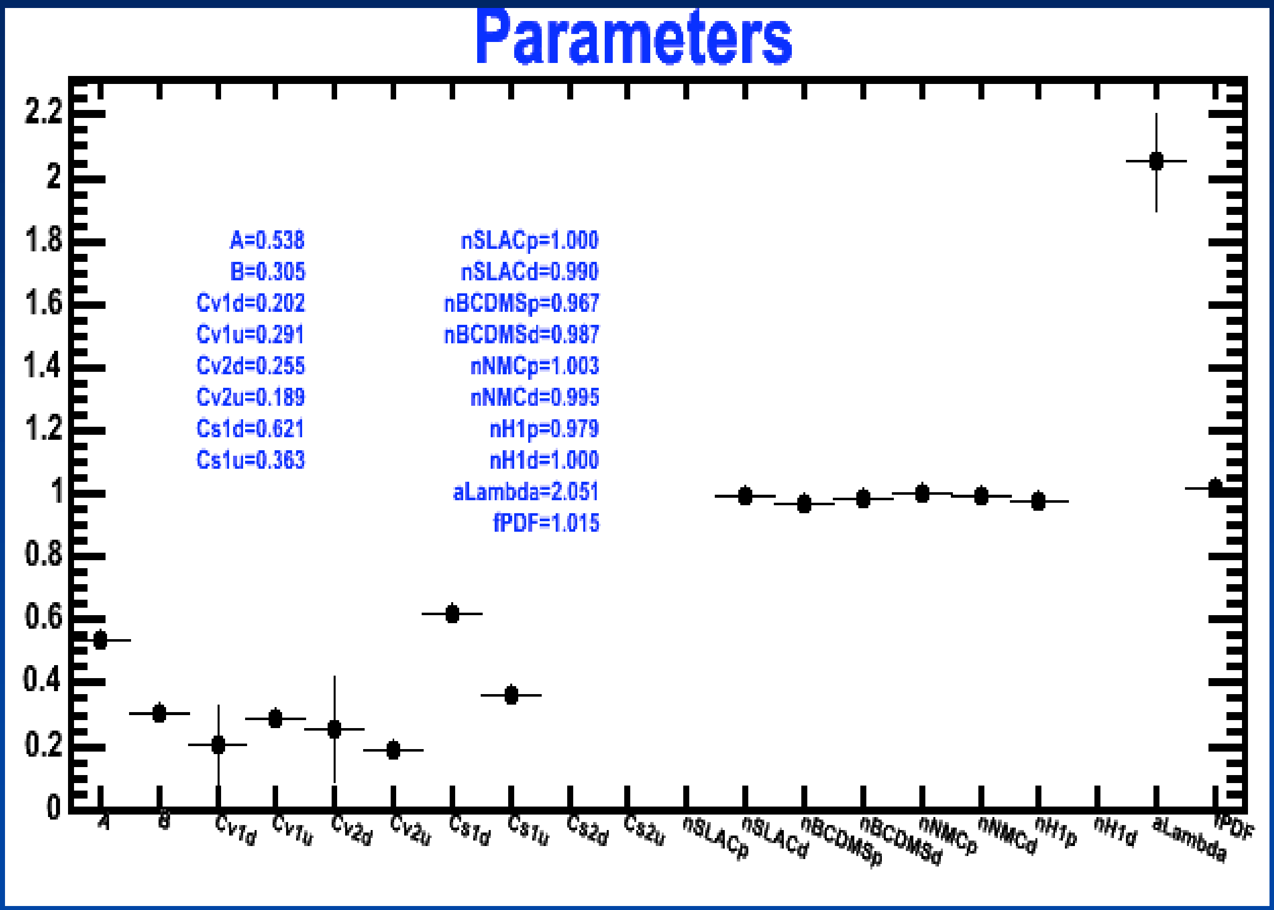
2004 Updates on effective LO model

- Improvements in our model
  - Separate low Q^2 corrections to d and u valence quarks, and sea quarks
  - Include all inelastic F2 proton/deuterium (SLAC/NMC/BCDMC /HERA), photo-production on proton/deuterium in the fits (the c-cbar photon-gluon fusion contribution is included, important at high energy)
- Toward axial PDFs (vector PDFs vs axial PDFs)
  - Compare to neutrino data (assume V=A)

    CCCFR-Fe, CDHS-Fe, CHORUS-Pb differential cross section (without c-cbar boson-fusion in yet - to be added next since it is high energy data)
  - We have a model for axial low Q2 PDFs, but need to compare t o low energy neutrino data to get exact parameters - next.

    Kvec = $Q^2/[Q^2+C1]$ -> Kax = $/[Q^2+C2]/[Q^2+C1]$

Fit results using the updated model



Separate K factors for uv, dv,us,ds

I. Summary and Plans

- Our effective LO model describe all F2 DIS, resonance, and photo-production data well.
- This model provide a good description on the neutrino cro ss section data (except axial vector contribution).
- Now working on the axial structure functions and next pla n to work on resonance fits.
- JUPITER at Jlab (Bodek, Keppel) taken January 05 - wil l provided electron-Carbon (also e-H and e-D and other nu clei such as e-Fe) in resonance region (summer 05)
- Future: MINERvA at FNAL (McFarland, Morfin) will provi de Neutrino-Carbon data at low energies.

II : Duality and QCD based fits to Nucleon Form Factors

Arie Bodek, R. Bradford, H. Budd -U. of Rochester
John Arrington- Argonne National Lab

$$2xF_1^{inel}(x,Q^2) = x^2 G_M^2(Q^2)\delta(x-1)$$
$$F_2^{inel}(x,Q^2) = \frac{G_E^2(Q^2)+\tau G_M^2(Q^2)}{1+\tau}\delta(x-1)$$

$$R(x=1,Q^2) = \frac{4M^2}{Q^2}\left(\frac{G_E^2}{G_M^2}\right)$$

$$G_D(Q^2) \equiv \frac{1}{(1+Q^2 r_0^2)^2}$$

$$r_0^2 = (0.24\ \mathrm{fm})^2 = 1/0.71\ (\mathrm{GeV})^{-2}$$

Duality: Rp=Rn (inelastic) at high Q2 near x=1.

QCD and Duality: At High Q2 near x=1 F1n/F1p =(Gmn/Gmp)^2

Use F1n/F1p predicted with d/u = 0.2 at x=1 (From QCD)

Use a form proposed by J. J. Kelly Phys. Rev. C 70, 068202 (2004). This form satisfies QCD constraints at High Q2 with 4 parameters for Gep, Gmp, Gmn.

$$G(Q^2) \propto \frac{\sum_{k=0}^{n} a_k \tau^k}{1 + \sum_{k=1}^{n+2} b_k \tau^k}, \qquad (1)$$

where both numerator and denominator are polynomials in $\tau = Q^2/4m_p^2$ and where the degree of the denominator is larger than that of the numerator to ensure that $G \propto Q^{-4}$ for large Q^2. For magnetic form factors we include a factor of μ on the right-hand side, such that $a_0 \approx 1$ if the data for low Q^2 are normalized accurately. With $n=1$ and $a_0=1$, this parametrization provides excellent fits to G_{Ep}, G_{Mp}/μ_p, and G_{Mn}/μ_n using only four parameters each. However, this approach is less successful for G_{En} because the existing data are still too limited. Therefore, for G_{En} I continue to use the Galster parametrization [8],

$$G_{En}(Q^2) = \frac{A\tau}{1 + B\tau} G_D(Q^2),$$

where $G_D = (1 + Q^2/\Lambda^2)^{-2}$ with $\Lambda^2 = 0.71$ (GeV/c)^2

For Gen Kelly uses the Galster Parametrization

PHYSICAL REVIEW C **70**, 068202 (2004)

TABLE I. Parameters fitted to data for nucleon electromagnetic form factors. The normalization parameter $a_0 = 1$ was held constant. The second column lists chi-square per datum.

Quantity	χ^2/N	a_1	b_1	b_2	b_3	$r_{\rm rms}$ (fm)	A	B	$\langle r_n^2 \rangle$ (fm^2)
G_{Ep}	0.78	−0.24±0.12	10.98±0.19	12.82±1.1	21.97±6.8	0.863±0.004

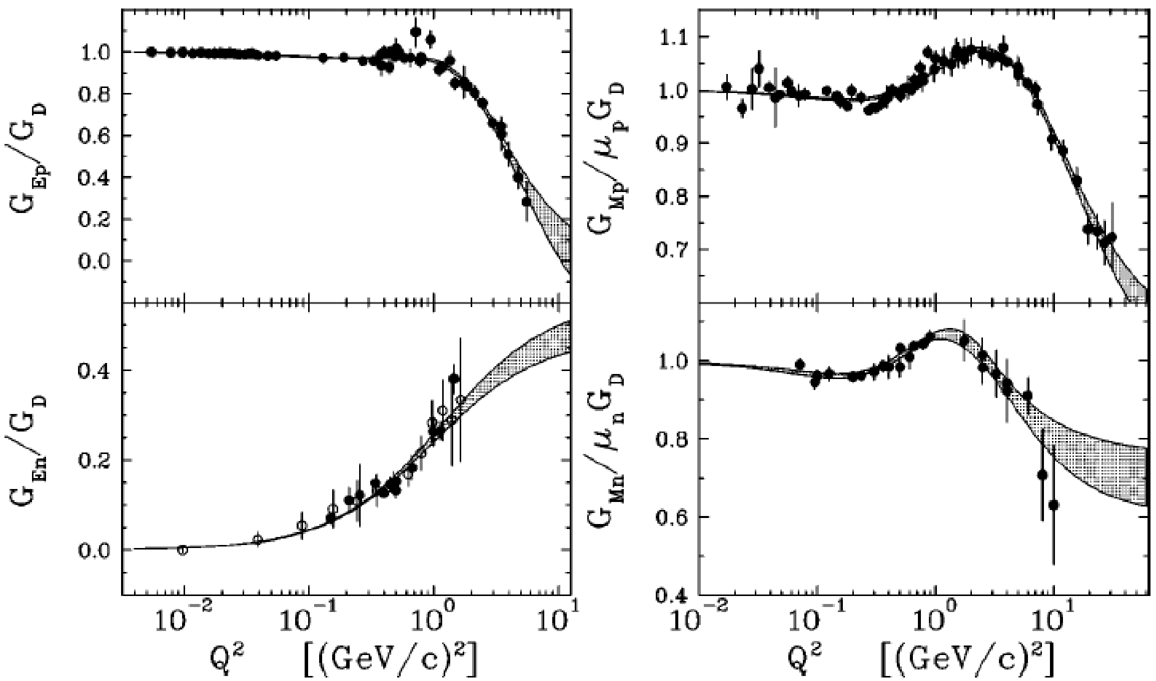

FIG. 1. Fits to nucleon electromagnetic form factors. For G_{En}, data using recoil or target polarization [16–22] are shown as filled circles while data obtained from the deuteron quadrupole form factor [23] are shown as open circles.

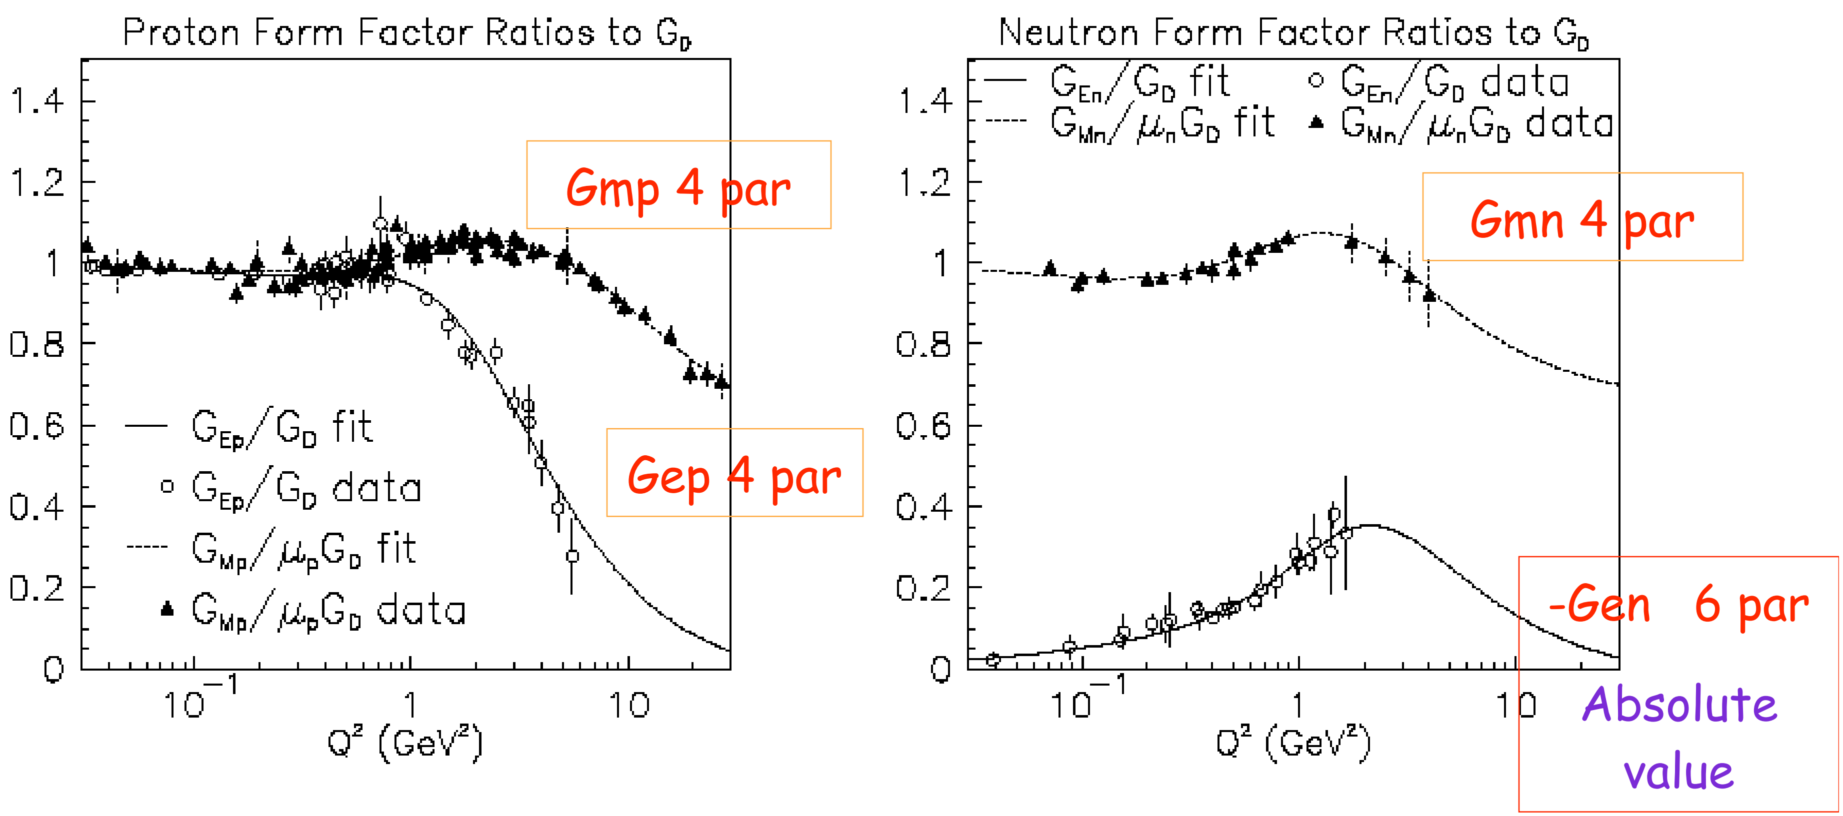

Figure 1: Our recent fits to G_E^p/G_{Dipole}, $G_M^p/\mu_p G_{Dipole}$ G_E^n/G_{Dipole}, and $G_M^n/\mu_p G_{Dipole}$. The data used to extract these fits are shown. These fits use constraints from QCD and duality at high Q^2, where there is no data.

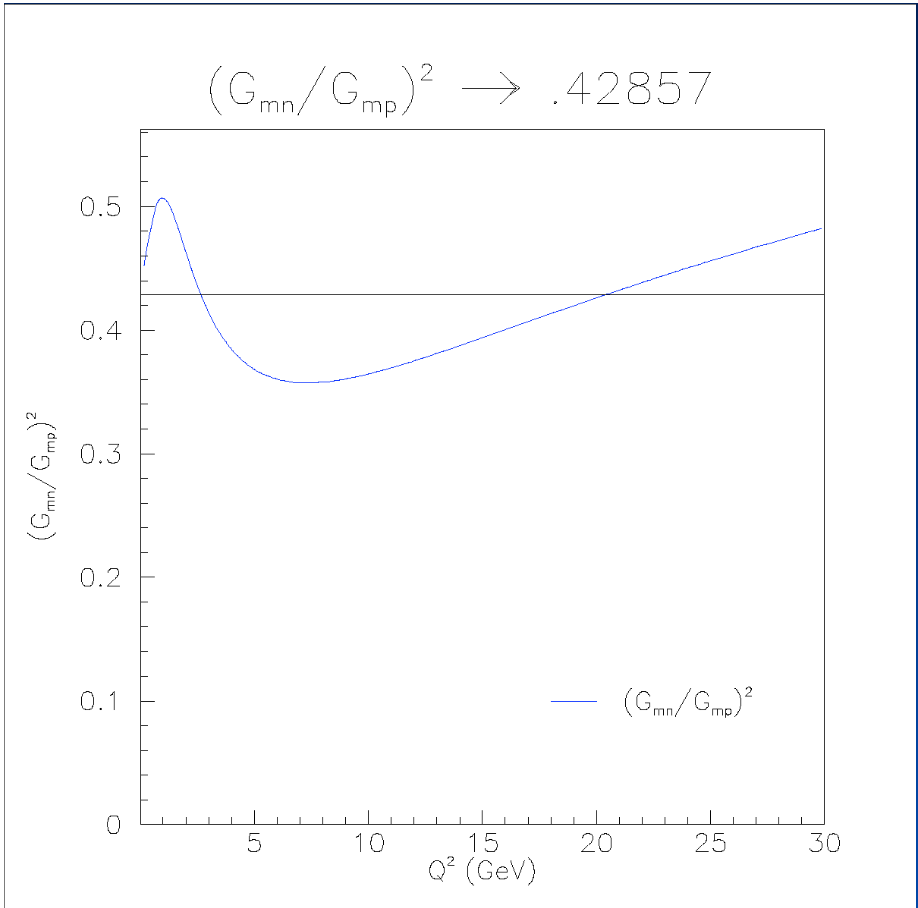
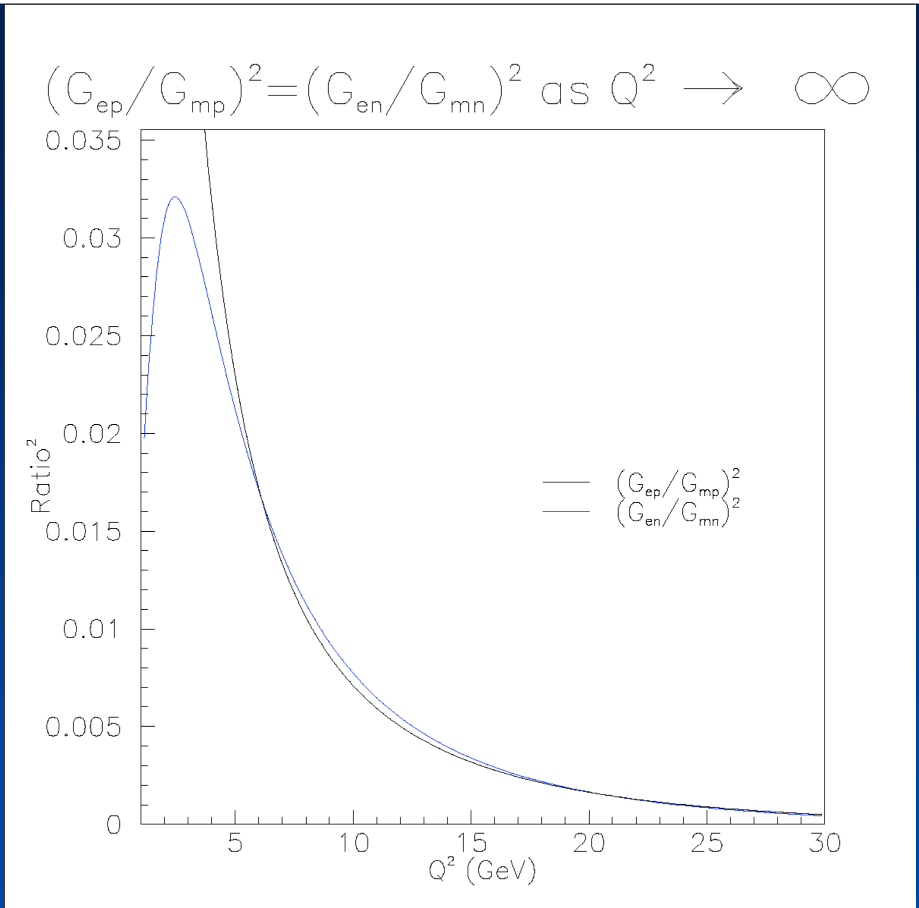
BBBA- 2005 - Bodek, Bradford, Budd, Arrington QCD-Duality Constraint Form Factors-----We refit the Form Factors using the Kelly Pramaterization for Gep, Gmp, Gmn, In addition, we use this parametrization (with 6 parameters) to also fit Gen. All parameters are varied such as to satisfy ACD duality constraints at high Q2.





QCD and Duality: At High Q2 near x=1

F1n/F1p =$(Gmn/Gmp)^2$ = 0.43

From F1n/F1p DIS prediction with

d/u = 0.2 at x=1 (From QCD)

Duality: Rp=Rn (inelastic) at high Q2 near x=1.

Implies |Gen/Gmn|=|Gep/Gmp|

- BBBA2005 Form Factors satisfy QCD and Duality constraints

BBBA- 2005 - Bodek, Bradford, Budd, Arrington QCD-Duality Constraint Form Factors - should work both at low and High Q2

Next (summer 2004)

(1) Working on getting better description of axial form factor Fa(Q2) using High Q2 QCD Duality Constraints for both vector and axial form factors and the Adler Sum rule.

(2) Compare to absolute value predictions from Duality using standard PDFs at high Q2.

Summary of Unified LO Approach works from Q2=0 to high Q2

For applications to Neutrino Oscillations at Low Energy (down to Q2=0) the best approach is to use a LO PDF analysis (including a more sophisticated target mass analysis) and modify to include the missing QCD higher order terms via Empirical Higher Twist Corrections.

Reason:

For Q2>5 both Current Algebra exact sum rules (e.g. Adler sum rule) and QCD sum rules (e.g. momentum sum rule) are satisfied. This is why duality works in the resonance region (Here we can also use NNLO QCD analysis or a modified leading order analysis): Use duality + Adler to constrain elastic vector and axial form factors.

For Q2<1, QCD corrections diverge, and all QCD sum rules (e.g momentum sum rule) break down, and duality breaks down in the resonance region. In contrast, Current Algebra Sum rules e,g, Adler sum rule which is related to the Number of (U minus D) Valence quarks) are valid.

Our unified approach works for both inelastic and elastic.
