Error

For WDNM, WDWM: no wall constraint in wall data generation step, error generation of a_wall. For NDWM, no wall constraint in wall model, no error.

[#0] ERROR:Generation -- a_wall::RooRealVar:randomize: fails with unbounded fit range EvalPLR: TOY# = 1 n, POI_test = 0.1, POI_hat = 3.91522e-05, uncond_ML = -0.143198, cond_ML = -0.0902019, TS = 0.105991, mutot = 83.9009, time (create/fit1/2) 0, 0.14, 0.06, status (U/C) 0, 0

Graph(separated model)

Summary of Wall Test

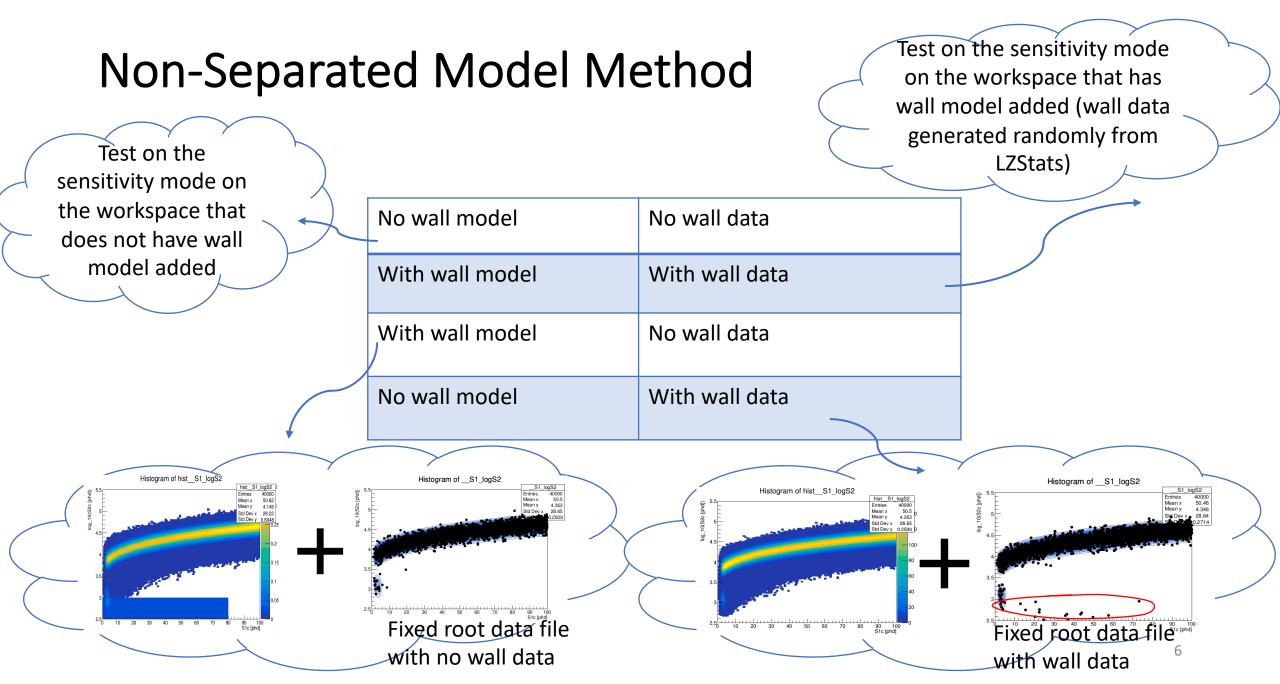

- Non-Separated Model
 - Method
 - Problem
 - Create Workspace:
 - Interpolation order
 - Initial mu_sig value
 - Data file
 - LZStats:
 - Calculator type

• Output

- Parameter
- Constraint function
- Graph
 - Constrained vs. non-constrained
 - Varying constraint sigma, S1
- Conclusion

Separated Model

- Method
- Problem
 - obs_data line
 - Initial fit
 - Failed toy
- Output
 - Parameter
 - Constraint function
 - Graph
 - Limit vs. logS2 vs. rate

Separated Model Method

• Motivation:

• With low rate, sometimes no generated data in the area of interest; only tests on one data file, the result is not very trustworthy

• Method:

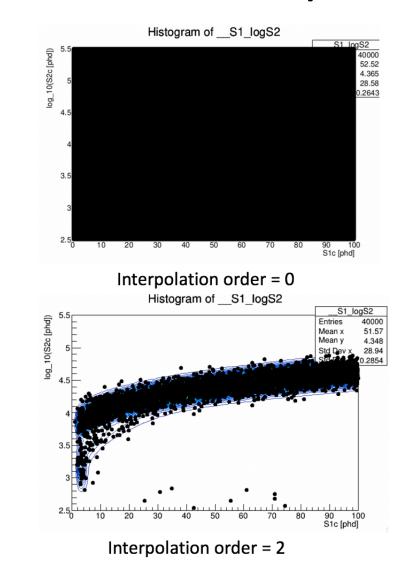

- Separate the model that generates dataset and the model that is used for fitting
- Same process for NDNM & WDWM cases in non-separated model cases
- For WDNM & NDWM cases, the data file will be generated randomly for fitting instead of fixed data file

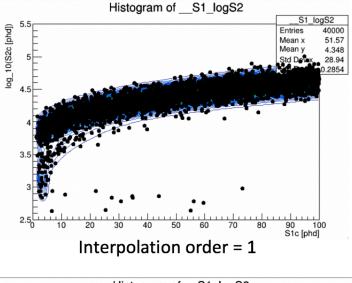

Improvement:

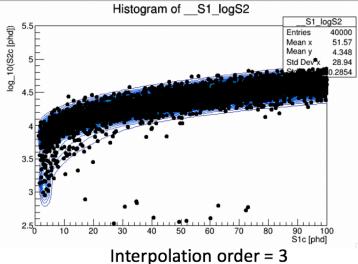

- The tested data is randomly generated for each toy trial
- For WDNM, if one data file failed the test, it will just fail the toy trial, not crash the whole test

Problem: Oth interpolation

Data file generated from the workspace is totally black for the 0th interpolation order

Initial mu_sig

- **Problem:** For the with wall model, no wall data case, the obs_data line is constant at zero
- Analysis: since there is no wall data, but there is a wall model, so when running LZStats, it creates more mu_sig events to compensate for the difference

Calculator Type

• Run LZStats with calculator type 1, with high toys (~500) crashed in the middle, works fine for lower toy numbers, 100 toys

With Model, with data Calculator Type = 1 With model, with data Calculator Type = 0

Output: Parameter

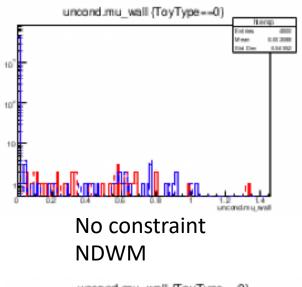

• Workspace:

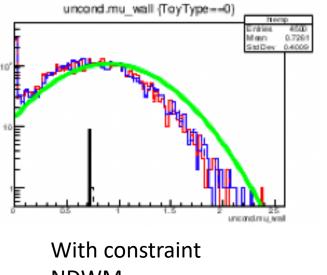

- Livedays = 60d
- WIMP_mass = 40 GeV
- Interpolation order = 1
- Wall model:
 - Rate = 0.015 events/day
 - S1 = 80
 - logS2 = 3

LZStats:

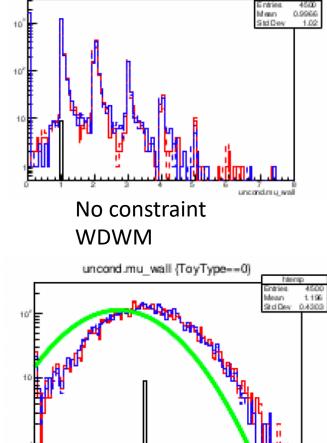

- MIN_POI = 0.1
- MAX_POI = 10
- Ntoys = 500
- LogScan
- N_POI_Scan = 9
- Calculator Type = 0
- Two-sided test

Constraint

Conclusion

The obs_data line gives similar upper limit as the best-fit line and fluctuates within the 1-sigma band

	No wall model	No wall data
	With wall model	With wall data
	With wall model	No wall data
	No wall model	With wall data
I		

- The obs_data line gives a better limit than the expected median line and fluctuates at the lower bound (2-sigma band)
- 2. The datafile does not have wall data in it, but since the workspace has a wall model, each toy has wall data in it
- If the wall data is around the ⁸B region, get a significantly worse limit; if the wall data is far from the ⁸B region, get an error running LZStats
- However, the problems can be solved by adding a wall model :back to the case of with both wall model and wall data case → gives a better limit and runs LZStats successfully

Separated Model Method

- Motivation: With low rate, sometimes no generated data in the area of interest; only tests on one data file, the result is not very trustworthy
- Separate the model that generates dataset and the model that is used for fitting
- Same process for NDNM & WDWM cases in non-separated model cases
- For WDNM & NDWM cases, the data file will be generated randomly for fitting instead of fixed data file,

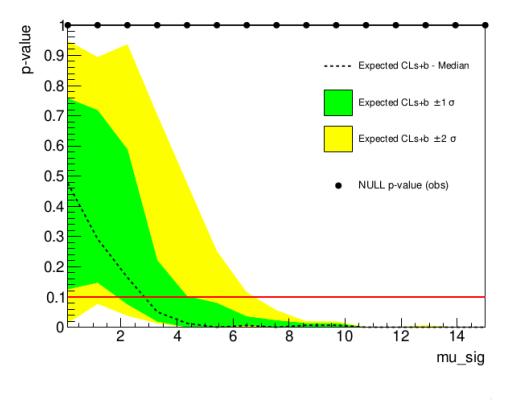

Problem: obs_data line

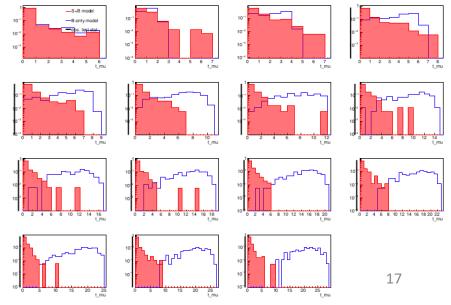

Problem:

- 1. Constant Obs_data line at p-value = 1
- 2. Negative Obs_data line in TS plot

Solution:

Set *bool use_observed_data = false* in analyse_output.C

Initial fit

Crash → Set RUN_INITIAL_FIT: false in Parameters.yaml

There was a crash.
