

Pegasus 5.0 Tutorial

Workflow Management System

Karan Vahi

University of Southern California, School of Engineering
Information Sciences Institute
vahi@isi.edu

Setup

It is the same (but hosted) as the self-guided tutorial available in the Pegasus documentation: <https://pegasus.isi.edu/documentation/user-guide/tutorial.html>

Please claim an instance by putting your name next to an unused instance in: shorturl.at/oEP12 (see Zoom chat for clickable link!)

Follow the link next to your name.

Docker Container / Jupyter Notebook

Container is for tutorial purposes - most production workflows have dedicated submit hosts

Jupyter is optional. You can choose to use just the workflow abstraction API, the full workflow management API, inside or outside Jupyter.

API

Key Pegasus Concepts

▲ Pegasus WMS == Pegasus planner (mapper) + DAGMan workflow engine + HTCondor scheduler/broker

- Pegasus maps workflows to infrastructure
- DAGMan manages dependencies and reliability
- HTCondor is used as a broker to interface with different schedulers

▲ Workflows are DAGs

- Nodes: jobs, edges: dependencies
- No while loops, no conditional branches
- Jobs are standalone executables

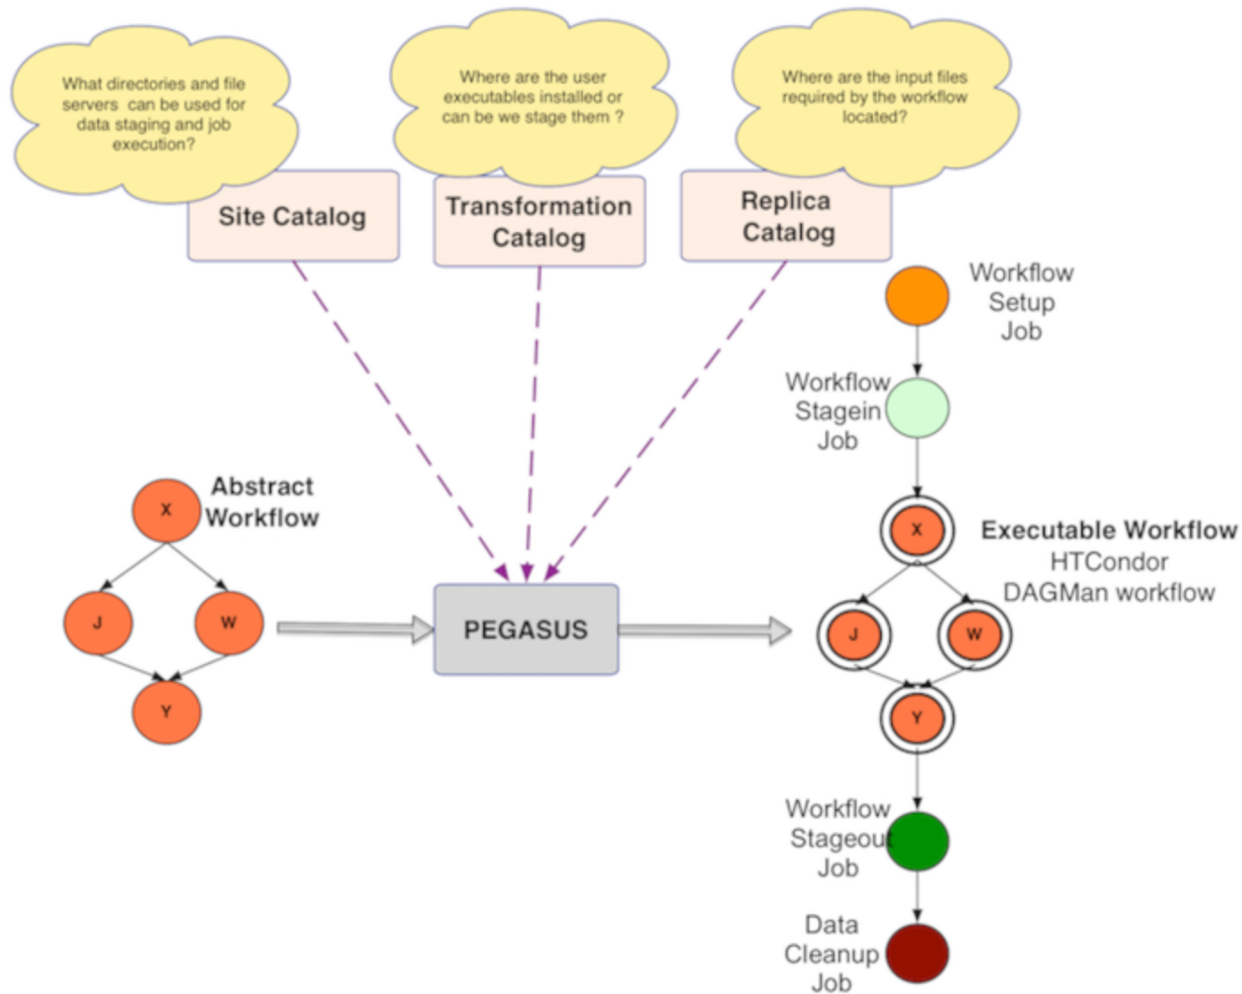

▲ Planning occurs ahead of execution

▲ Planning converts an abstract workflow into a concrete, executable workflow

- Planner is like a compiler

Debugging

Command Line Tools

Summary

Pegasus

est. 2001

Automate, recover, and debug scientific computations.
