An Introduction to Using HTCondor

HTCondor Week 2022

Christina Koch

Covered In This Tutorial

- What is HTCondor?
- Set up and Run a Job with HTCondor
- Submit Multiple Jobs with HTCondor

(pause for questions)

- How HTCondor Matches and Runs Jobs
- Testing and Troubleshooting
- Use Cases and HTCondor Features
- Automation

Introduction

What is HTCondor?

- Software that schedules and runs computing tasks on computers

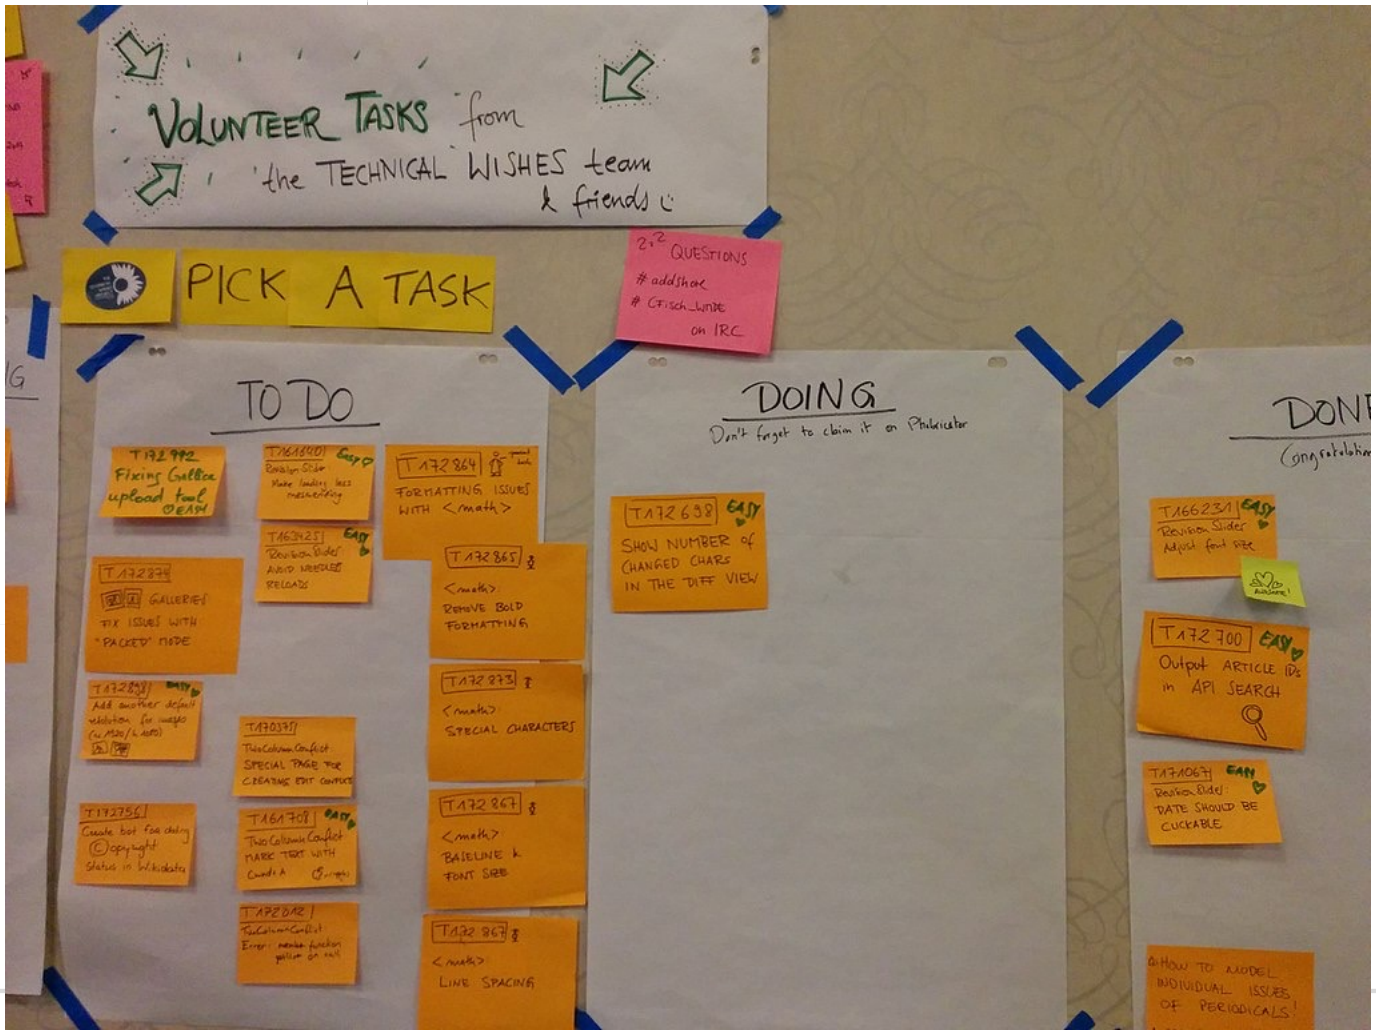

Photo by Johanna Strodt on WikiMedia, CC-BY-SA

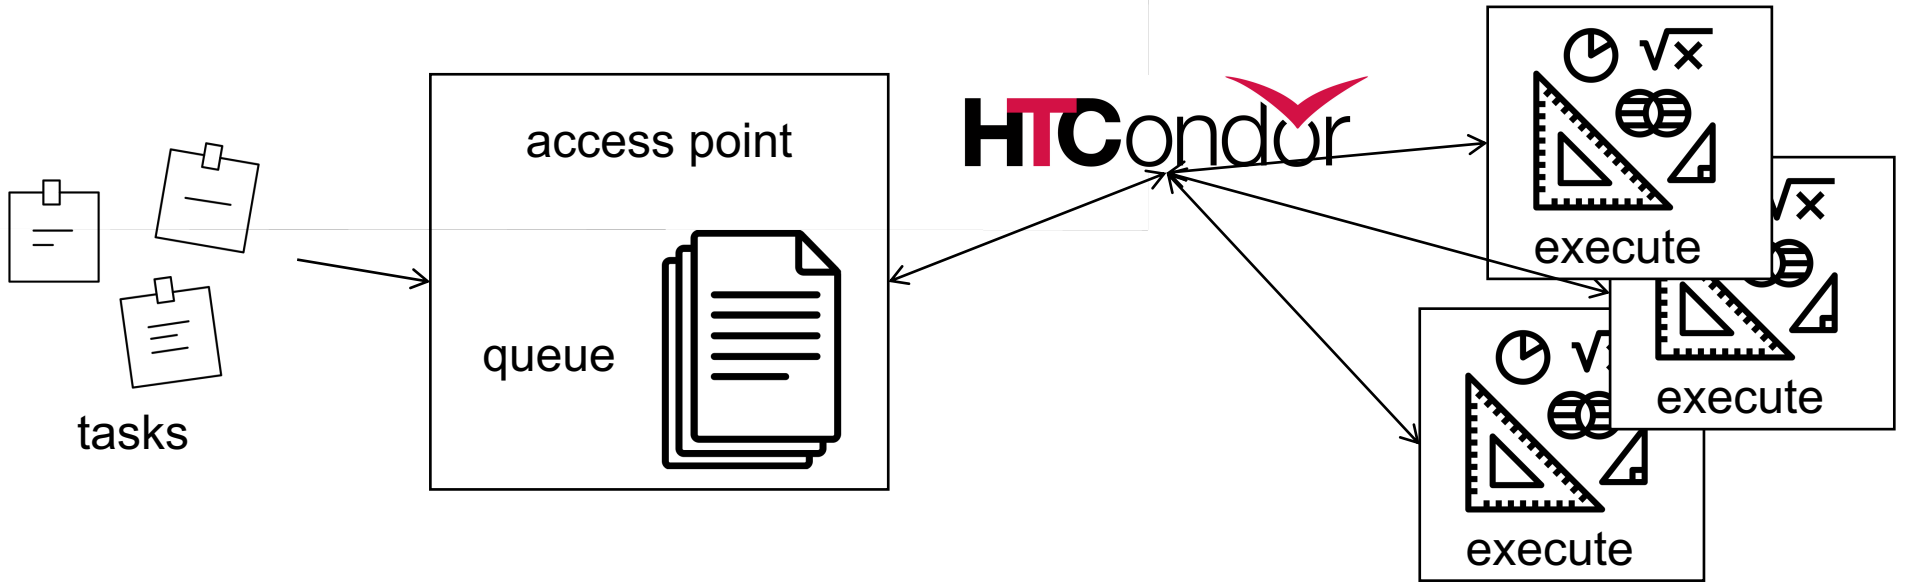
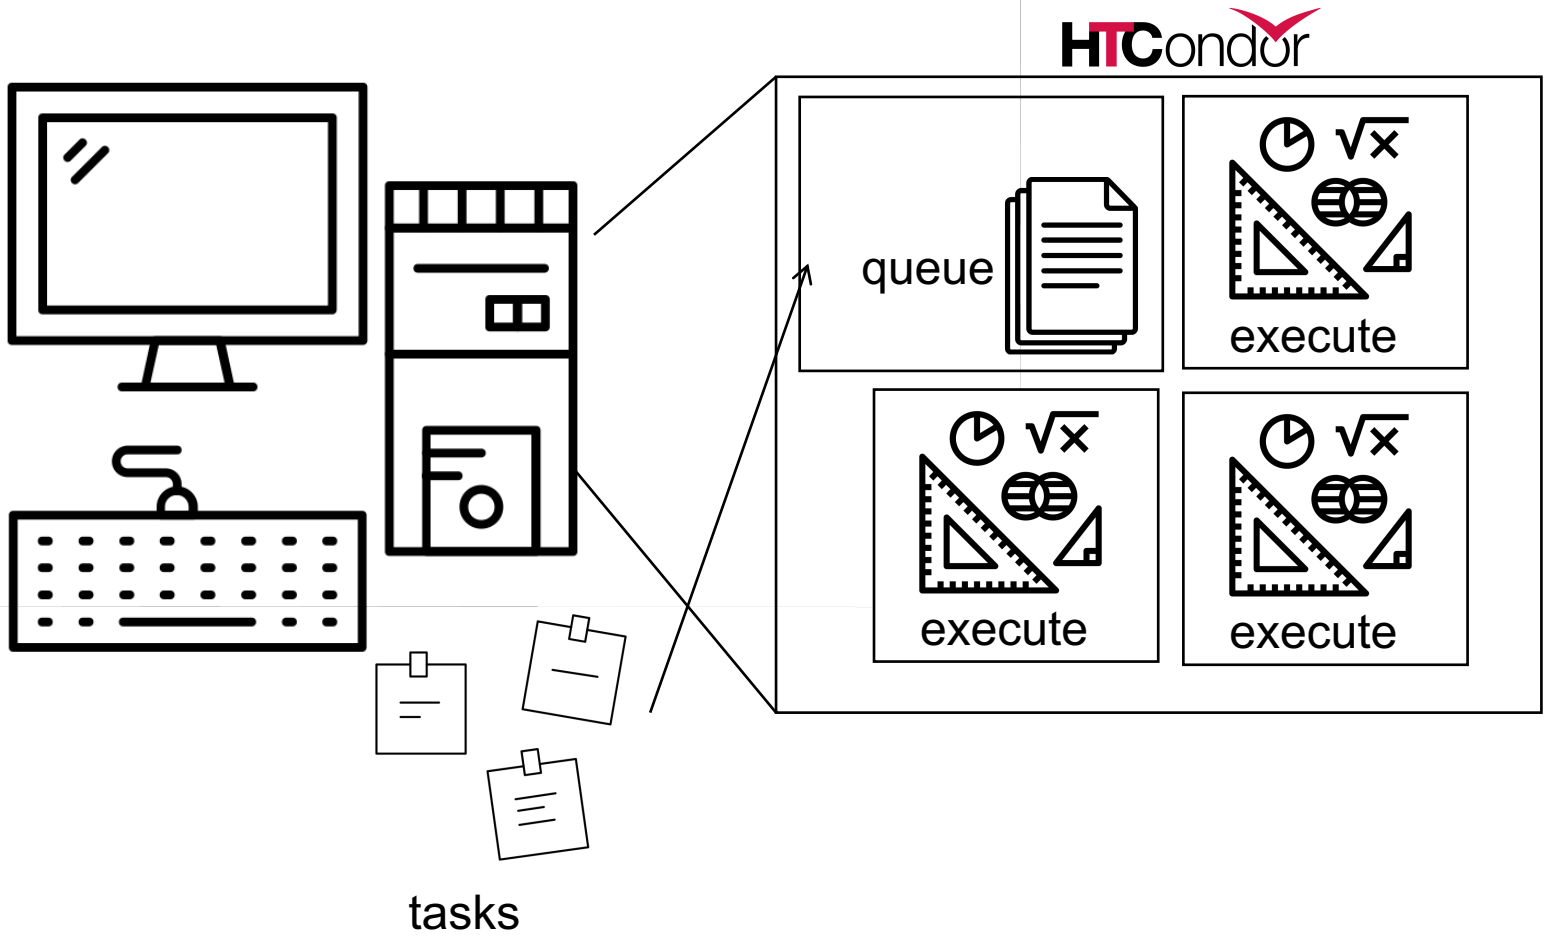
How It Works

- Submit tasks to a queue (on an Access Point)
- HTCondor schedules them to run on computers (Execute Points)



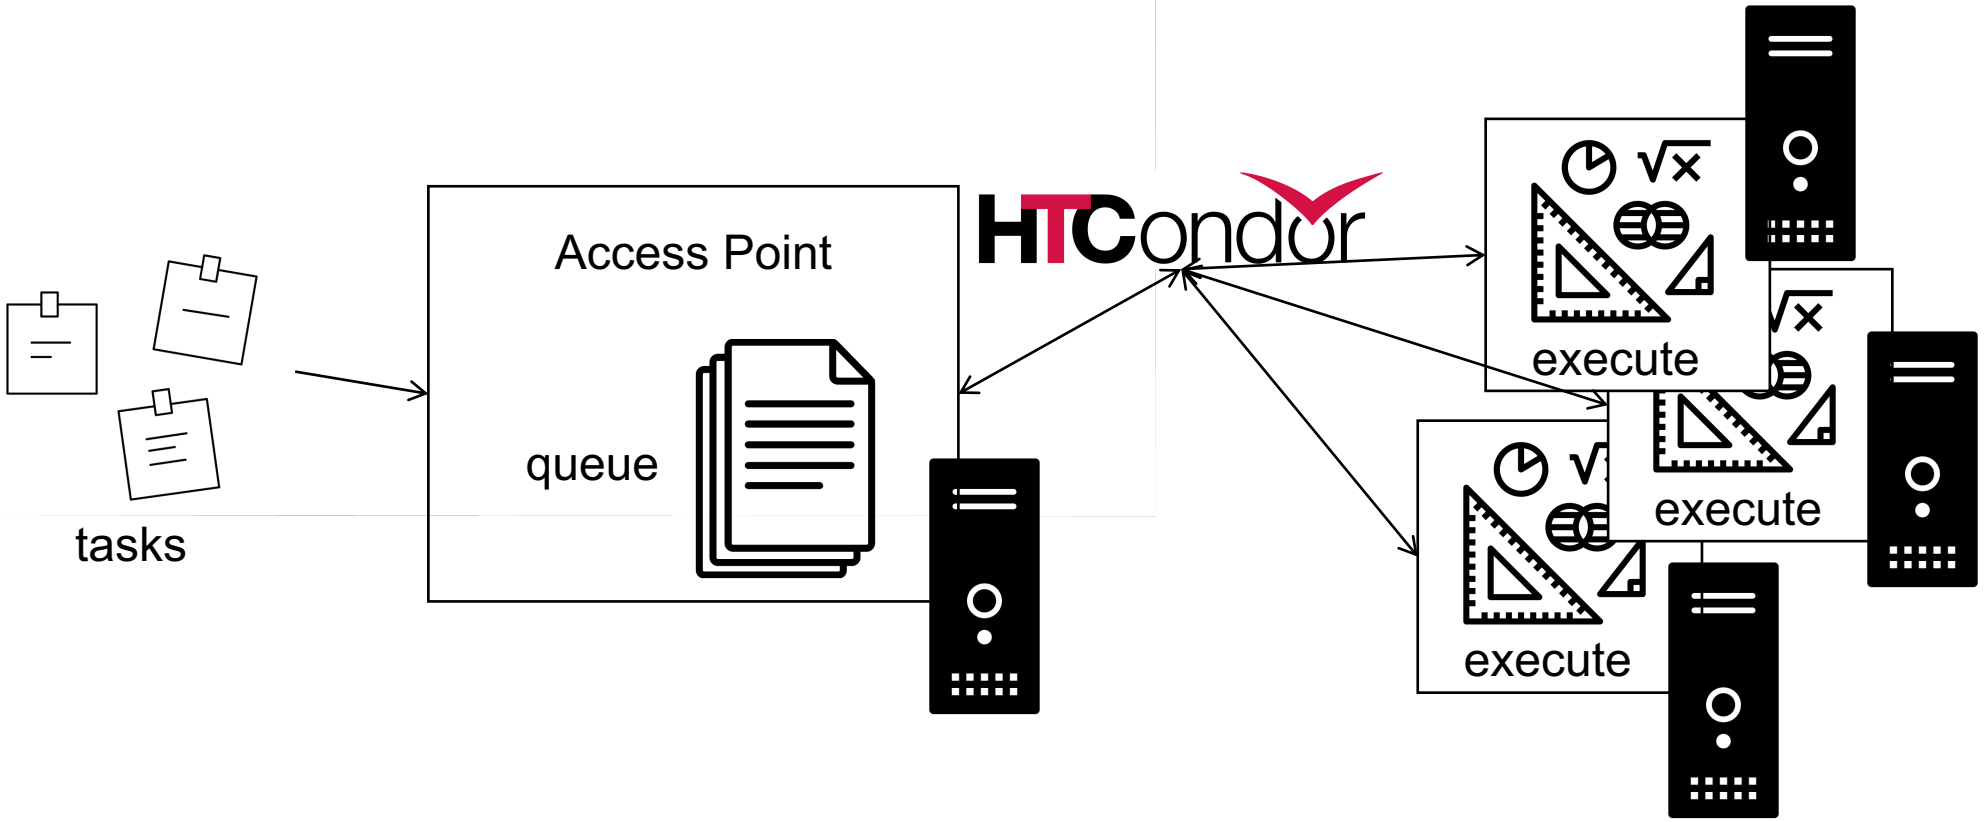
Post It by Arianna Galimberti; papers by jabbar; Math by Turkkub from the Noun Project

HTCondor on One Computer



Computer by rivercon from the Noun Project

HTCondor on Many Computers



computer tower by Ralf Schmitzer from the Noun Project

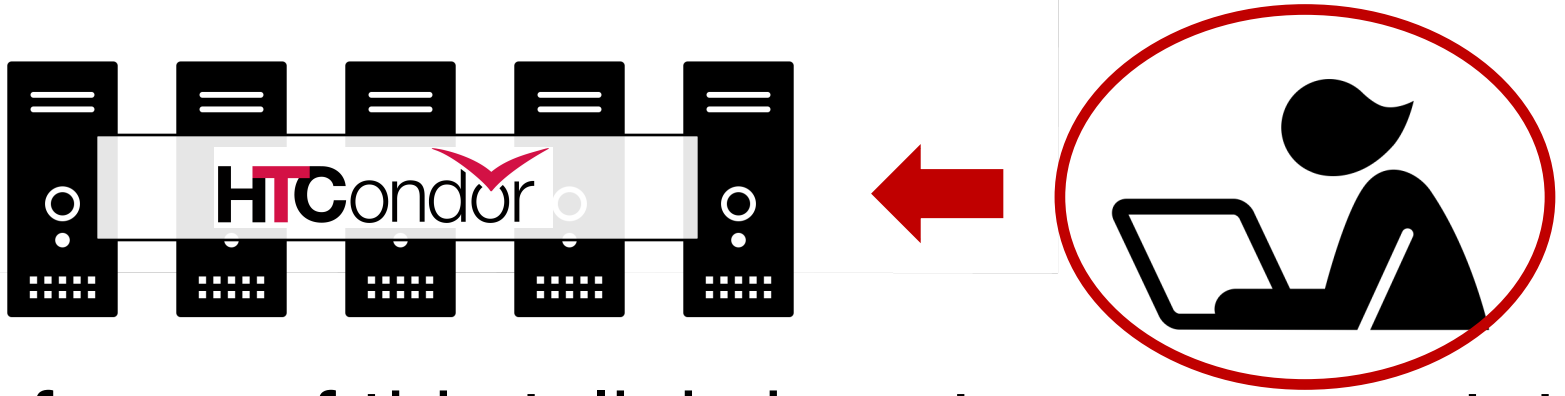
Why HTCondor?

- HTCondor manages and runs work on your behalf.
- Manage shared resources among users:
  - Schedule tasks on a single computer to manage computer capacity.
  - Schedule tasks on a group* of computers (which may/may not be directly accessible to the user).
  - Schedule tasks submitted by multiple users on one or more computers.

*in HTCondor-speak, a “pool”

User-Focused Tutorial

- For the purposes of this tutorial, we are assuming that someone else has set up HTCondor on a computer/computers to create a HTCondor “pool”.



- The focus of this talk is how to run computational work on this system.

computer user by Luis Prado from the Noun Project

Set Up and Run a Job with HTCondor

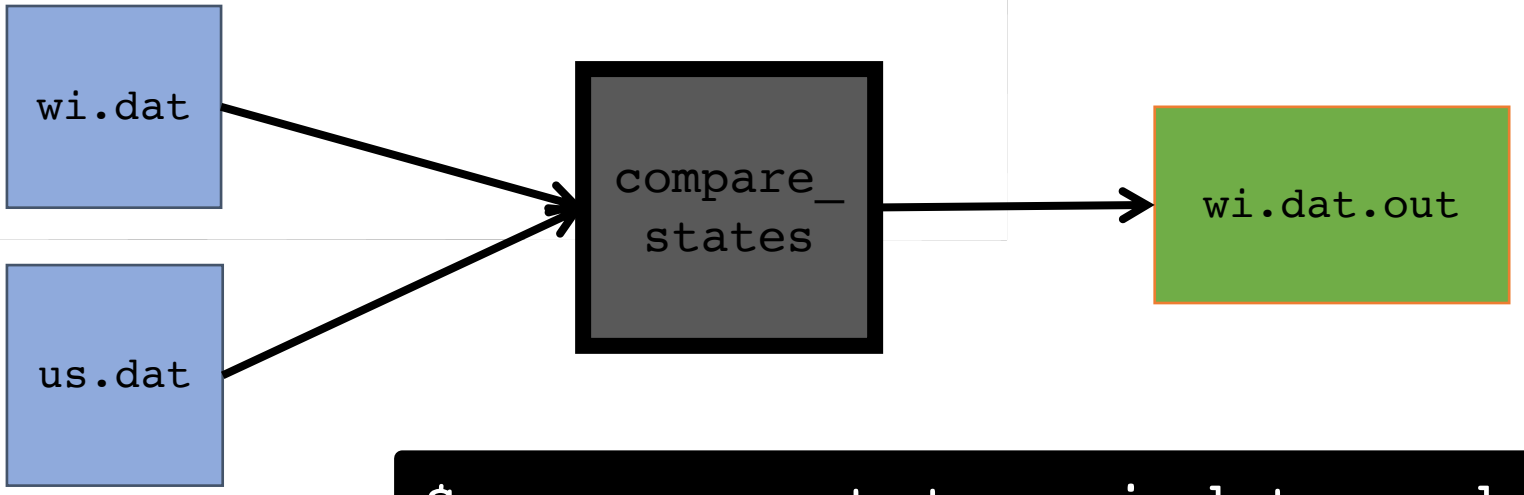
Jobs

- A single computing task is called a “job”
- Three main pieces of a job are the input, executable (program) and output

- Executable must be runnable from the command line without any interactive input

Job Example

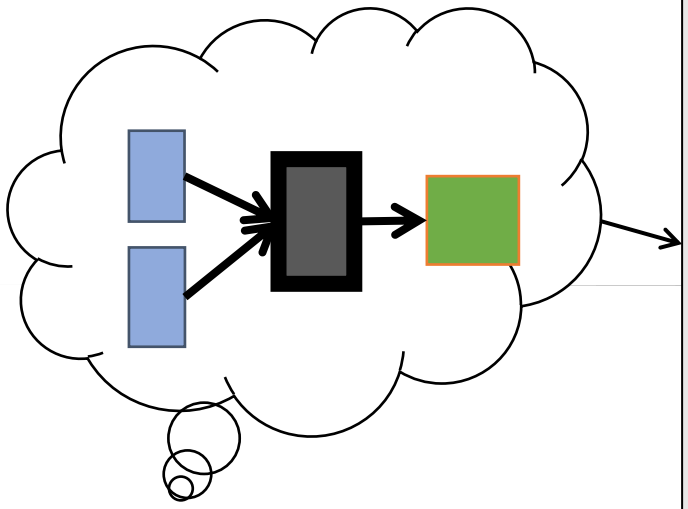
- For our example, we will be using an imaginary program called “compare_states”, which compares two data files and produces a single output file.



```
$ compare_states wi.dat us.dat wi.dat.out
```

Job Translation

- Submit file: communicates everything about your job(s) to HTCondor



```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

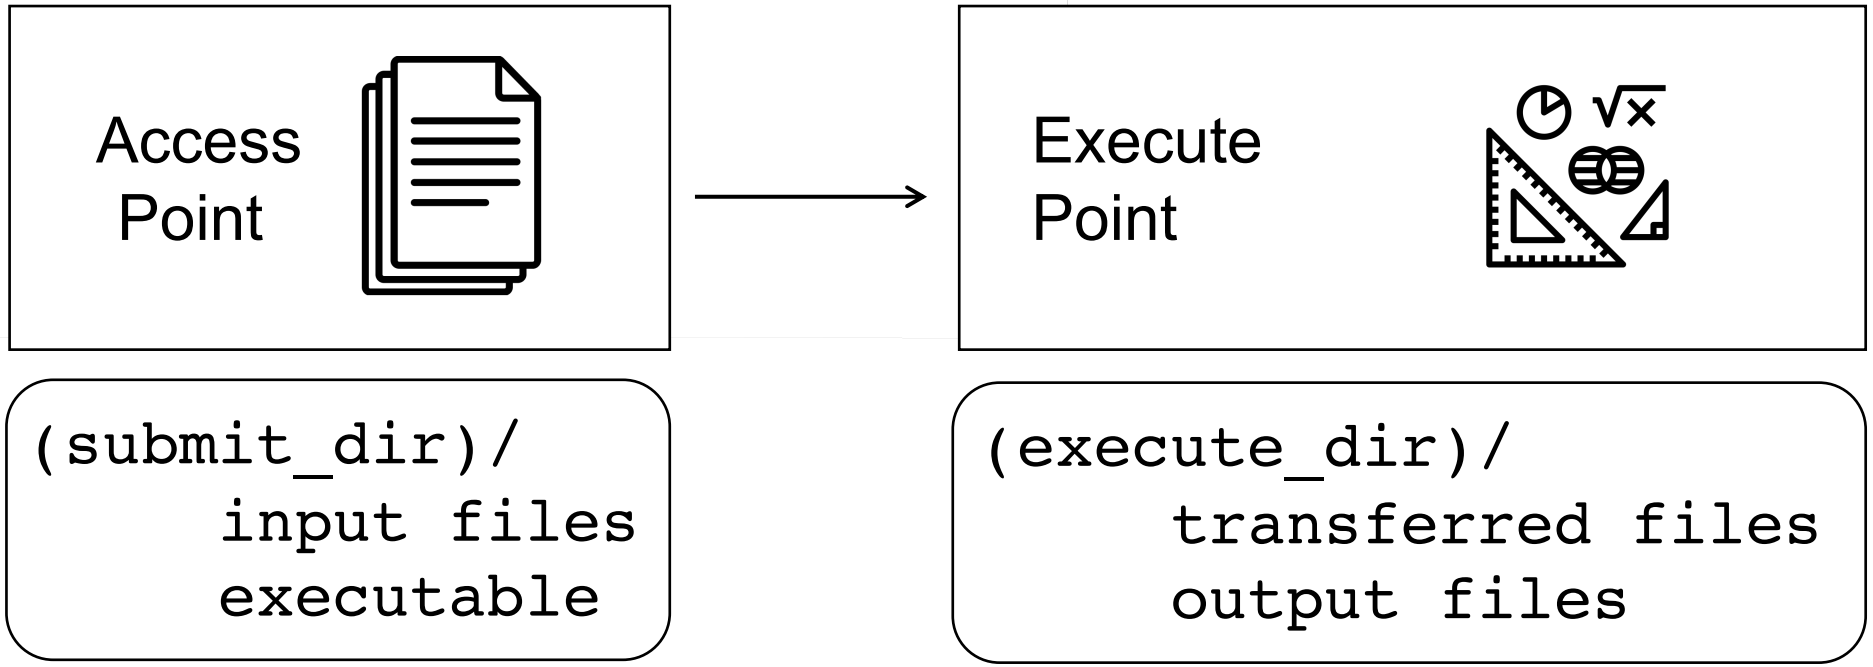
log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB

queue 1
```

File Transfer

- Our example will use HTCondor's file transfer option:



Submit File

job.submit

```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB
queue 1
```

Submit File

job.submit

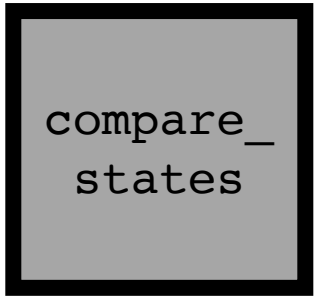
```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB
queue 1
```

- List your executable and any arguments it takes.



- Arguments are any options passed to the executable from the command line.

```
$ compare_states wi.dat us.dat wi.dat.out
```

Submit File

job.submit

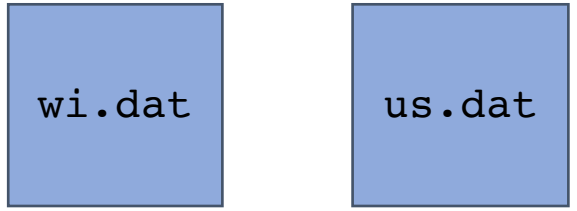
```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB
queue 1
```

- Indicate your input files.



- HTCondor will transfer back all new and changed files (usually output) from the job.

Submit File

job.submit

```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB
queue 1
```

- `log`: file created by HTCondor to track job progress
- `output/error`: captures stdout and stderr

Submit File

job.submit

```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB
queue 1
```

- Request the appropriate resources for your job to run.
- `queue`: keyword indicating “create a job.”

Submitting and Monitoring Jobs

- To submit a job/jobs:

  `condor_submit submit_file_name`

- To monitor submitted jobs, use:

  `condor_q`

HTCondor Manual: condor_submit
HTCondor Manual: condor_q

```
$ condor_submit job.submit
Submitting job(s).
1 job(s) submitted to cluster 128.
```

```
$ condor_q
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?... @ 05/01/19 10:35:54
OWNER  BATCH_NAME    SUBMITTED   DONE   RUN    IDLE  TOTAL JOB_IDS
alice  ID: 128       5/9  11:09     _      _      1      1 128.0

1 jobs; 0 completed, 0 removed, 1 idle, 0 running, 0 held, 0 suspended
```

More about `condor_q`

- By default **`condor_q`** shows:
  - user's job(s) only, summarized in "batches"
- Constrain with username, **`ClusterId`** or full **`JobId`**, which will be denoted **`[U/C/J]`** in the following slides.

```
$ condor_q
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?... @ 05/09/19 11:35:54
OWNER  BATCH_NAME    SUBMITTED   DONE   RUN    IDLE  TOTAL JOB_IDS
alice  ID: 128       5/9  11:09     _      _      1      1 128.0

1 jobs; 0 completed, 0 removed, 1 idle, 0 running, 0 held, 0 suspended
```

`JobId` = `ClusterId`.`ProcId`

More about `condor_q`

- To see individual job information, use:

  `condor_q -nobatch`

```
$ condor_q -nobatch
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
 ID          OWNER      SUBMITTED     RUN_TIME ST PRI SIZE CMD
128.0        alice      5/9  11:09   0+00:00:00 I  0    0.0 compare_states wi.dat us.dat

1 jobs; 0 completed, 0 removed, 1 idle, 0 running, 0 held, 0 suspended
```

- We will use the `-nobatch` option in the following slides to see extra detail about what is happening with a job

Job Idle

```
$ condor_q -nobatch
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
 ID          OWNER      SUBMITTED     RUN_TIME ST PRI SIZE CMD
128.0        alice      5/9  11:09   0+00:00:00 I  0    0.0 compare_states wi.dat us.dat

1 jobs; 0 completed, 0 removed, 1 idle, 0 running, 0 held, 0 suspended
```

Access Point

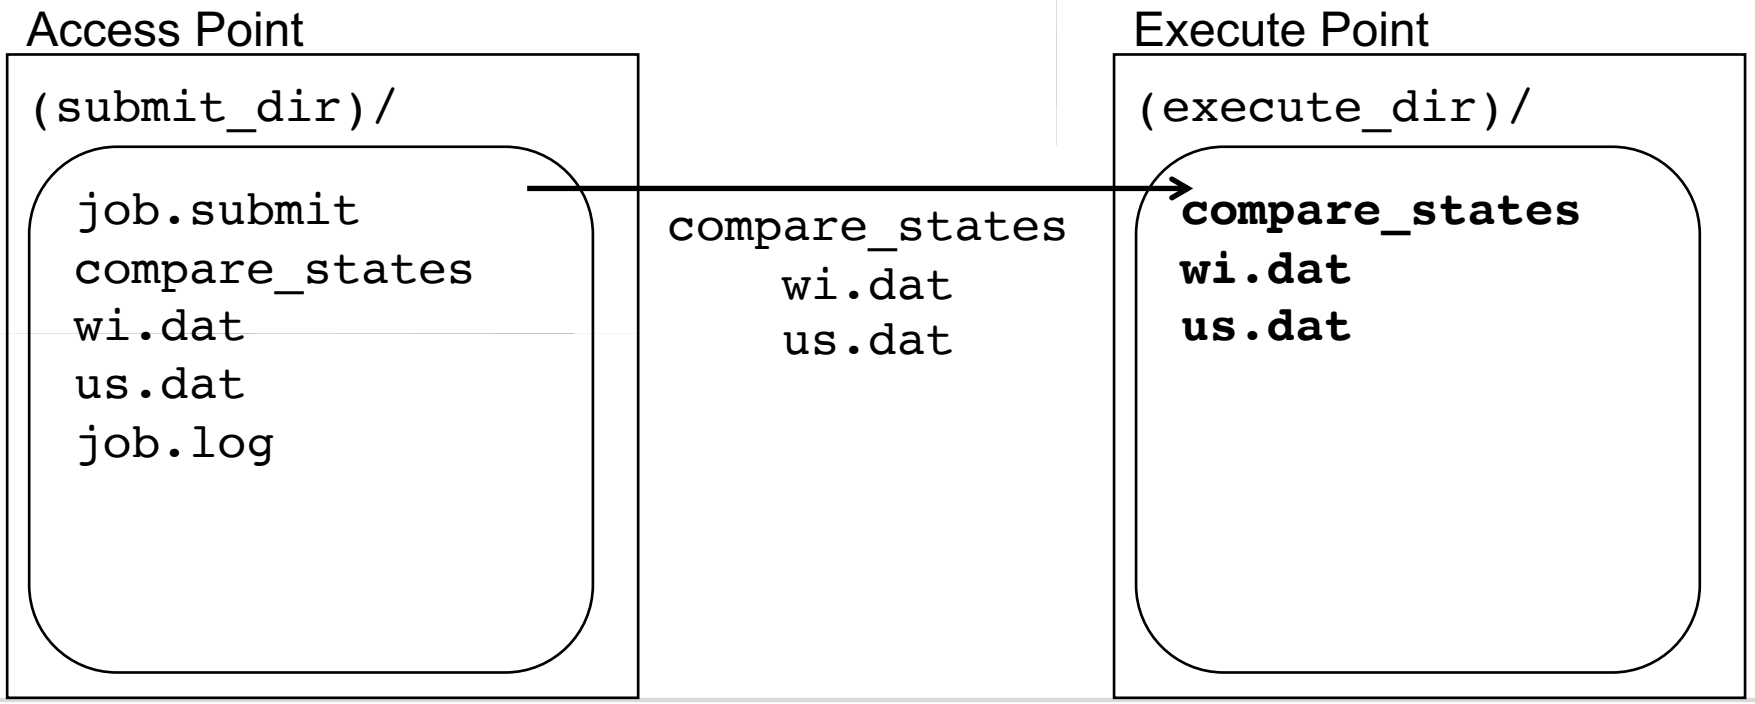
(submit_dir)/

- job.submit
- compare_states
- wi.dat
- us.dat
- **job.log**

Job Starts

```
$ condor_q -nobatch
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
 ID          OWNER      SUBMITTED     RUN_TIME ST PRI SIZE CMD
128.0        alice      5/9  11:09   0+00:00:00 <  0    0.0 compare_states wi.dat us.dat w

1 jobs; 0 completed, 0 removed, 0 idle, 1 running, 0 held, 0 suspended
```



Job Running

```
$ condor_q -nobatch

-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
 ID          OWNER       SUBMITTED     RUN_TIME ST PRI SIZE CMD
128.0        alice       5/9  11:09   0+00:01:03 R  0    0.0 compare_states wi.dat us.dat

1 jobs; 0 completed, 0 removed, 0 idle, 1 running, 0 held, 0 suspended
```

Access Point

```
(submit_dir)/
    job.submit
    compare_states
    wi.dat
    us.dat
    job.log
```

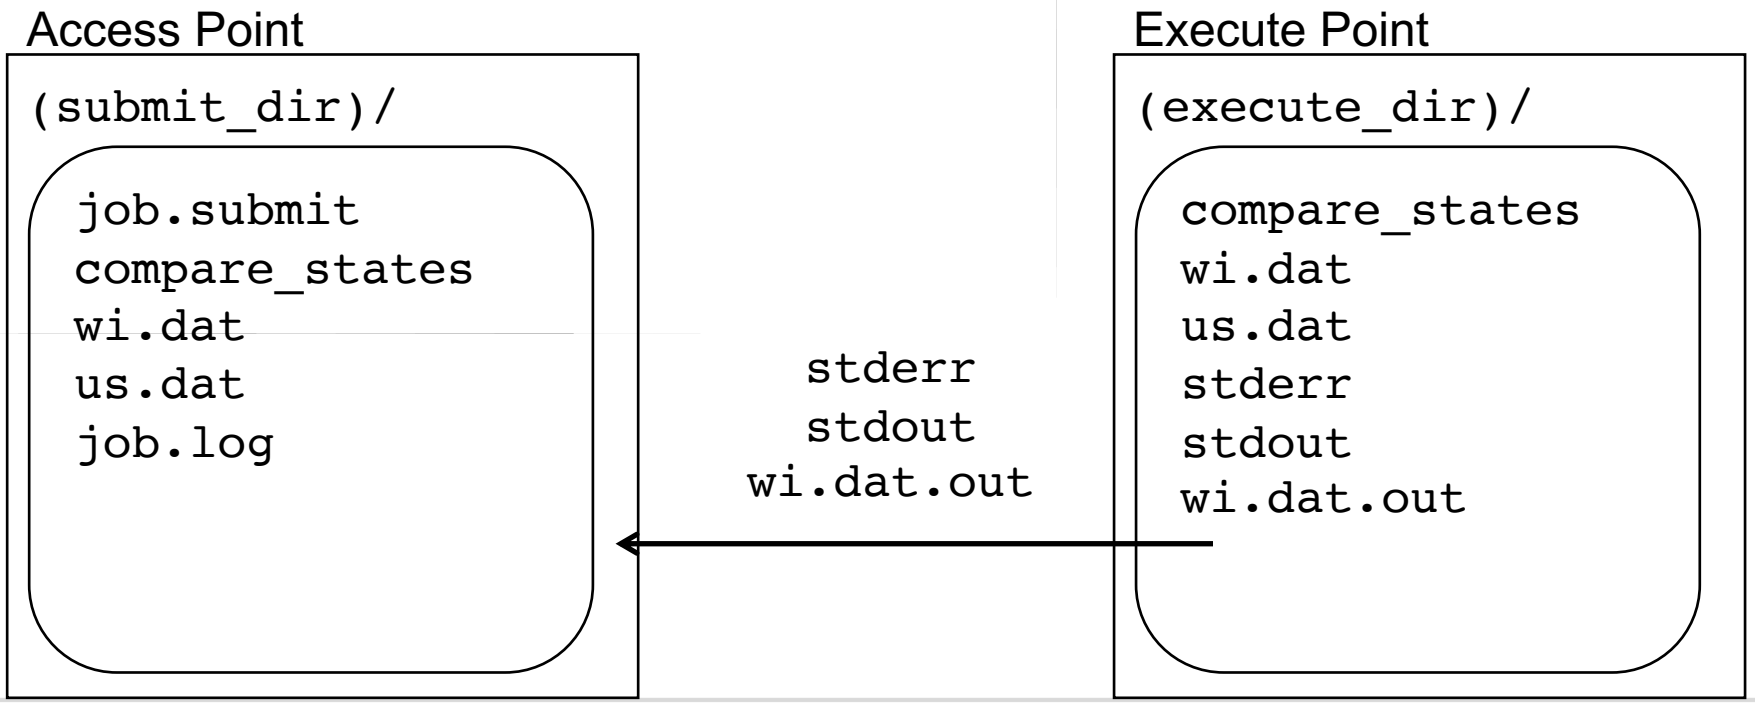
Execute Point

```
(execute_dir)/
    compare_states
    wi.dat
    us.dat
    stderr
    stdout
    wi.dat.out
```

Job Completes

```
$ condor_q -nobatch
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
 ID          OWNER      SUBMITTED     RUN_TIME ST PRI SIZE CMD
128          alice      5/9  11:09   0+00:02:02 >  0    0.0 compare_states wi.dat us.dat

1 jobs; 0 completed, 0 removed, 0 idle, 1 running, 0 held, 0 suspended
```



Job Completes (cont.)

```
$ condor_q -nobatch
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
 ID      OWNER            SUBMITTED     RUN_TIME ST PRI SIZE CMD

0 jobs; 0 completed, 0 removed, 0 idle, 0 running, 0 held, 0 suspended
```

Access Point

job.out job.err
wi.dat.out

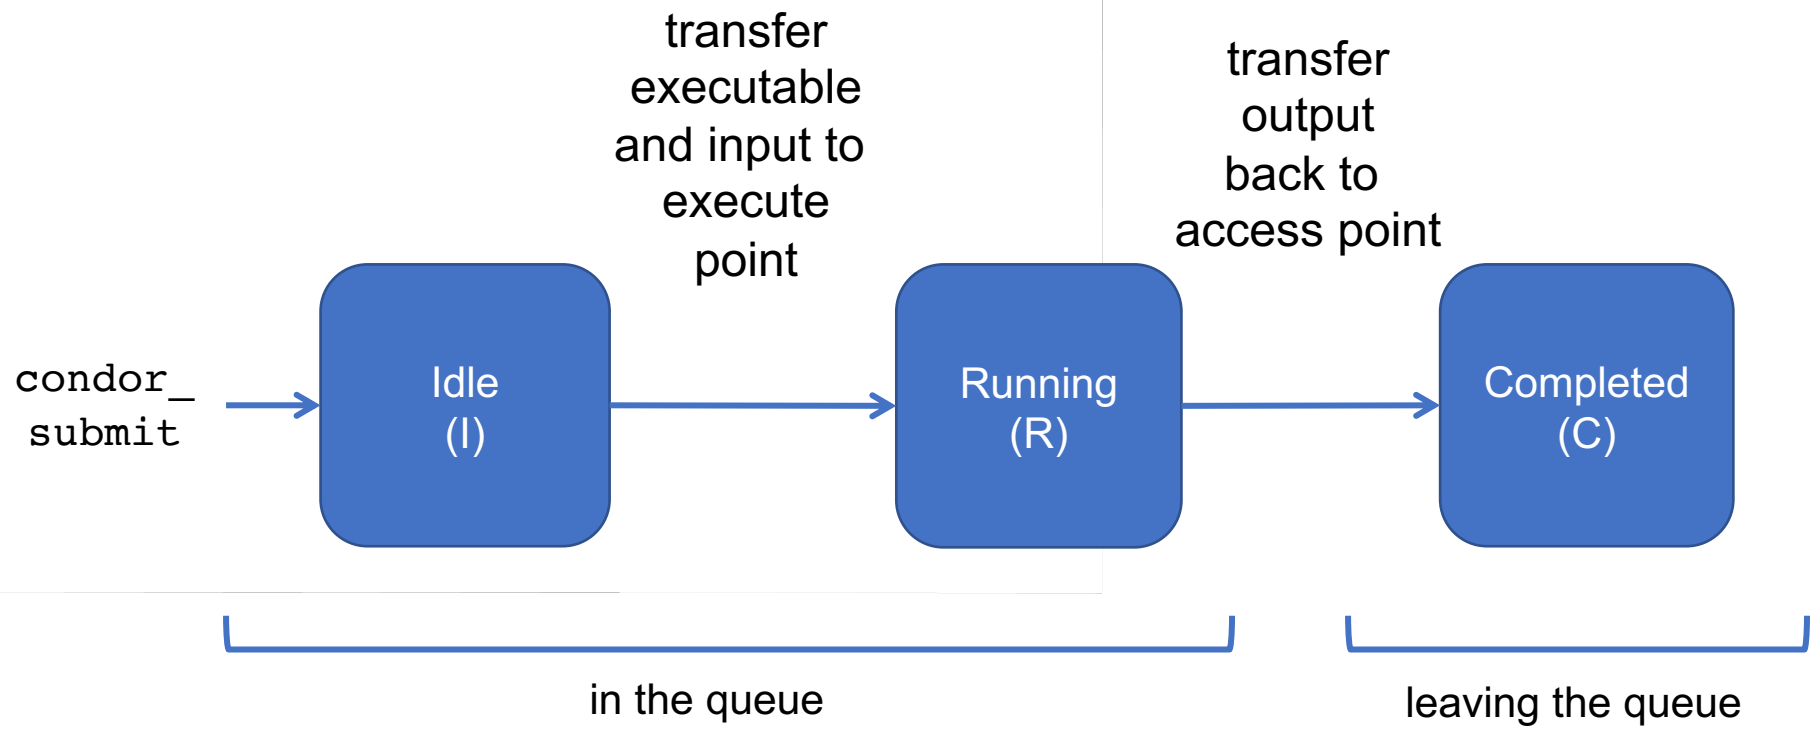
Log File

```
000 (7195807.000.000) 05/19 14:30:18 Job submitted from host:
<128.105.244.191:9618 ...>
......
040 (7195807.000.000) 05/19 14:31:55 Started transferring input files
        Transferring to host: <128.105.245.85:9618 ...>
...
040 (7195807.000.000) 05/19 14:31:55 Finished transferring input files
...
001 (7195807.000.000) 05/19 14:31:56 Job executing on host:
<128.105.245.85:9618? ...>
...
005 (7195807.000.000) 05/19 14:35:56 Job terminated.
        (1) Normal termination (return value 0)

        ...

        Partitionable Resources :    Usage  Request Allocated
           Cpus                 :        0        1         1
           Disk (KB)            :       26     1024    995252
           Memory (MB)          :        1     1024      1024
```

Job States



transfer executable and input to execute point
transfer output back to access point
condor_ submit
Idle (I)
Running (R)
Completed (C)
in the queue
leaving the queue

Assumptions

- Aspects of your submit file may be dictated by infrastructure and configuration.
- For example: file transfer
  - previous example assumed files would need to be transferred between access point/execute point

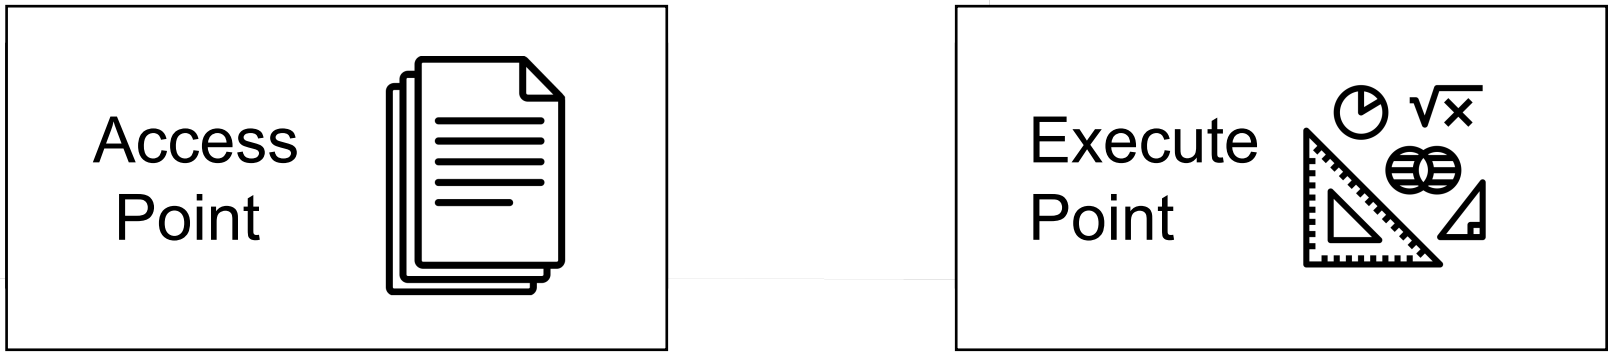
```
should_transfer_files = YES
```

  - not the case with a shared filesystem

```
should_transfer_files = NO
```

Shared Filesystem

- If a system has a shared filesystem, where file transfer is not enabled, the submit directory and execute directory are the same.



Shared Filesystem

job.submit

```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = NO

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_memory = 20MB
request_disk = 20MB

queue 1
```

Resource Request

- Jobs are nearly always using a part of a computer (a slot), not the whole thing.
- Very important to request appropriate resources (memory, cpus, disk) for a job.

Photo by Evan-Amos on WikiMedia, CC-BY-SA

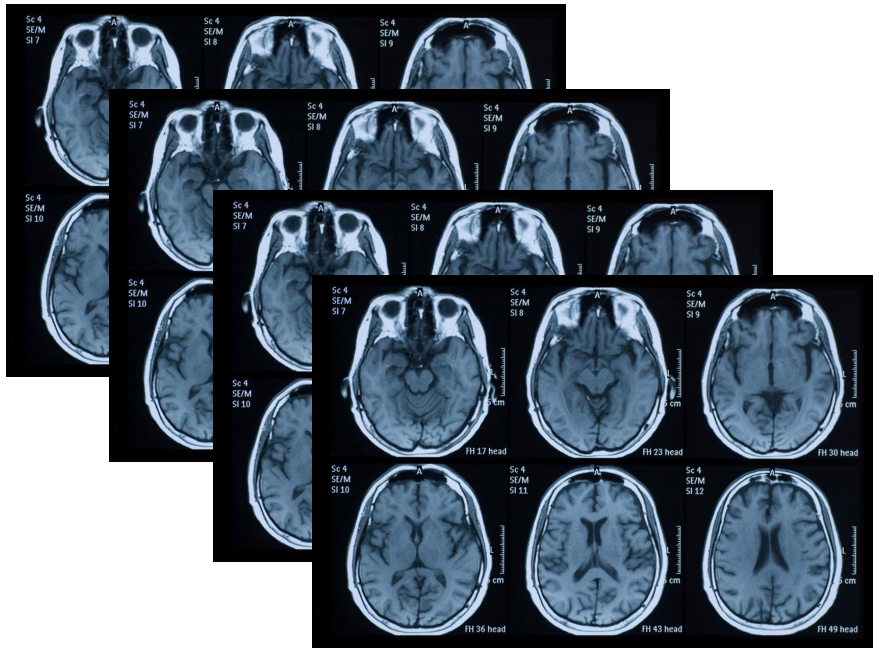
Resource Assumptions

- Even if your system has default CPU, memory and disk requests, these may be too small! (or change, unexpectedly)
- Important to run test jobs and use the log file to request the right amount of resources:
  - requesting too little: causes problems for your and other jobs; jobs might by held by HTCondor
  - requesting too much: jobs will match to fewer “slots”, take longer to match

Submit Multiple Jobs with HTCondor

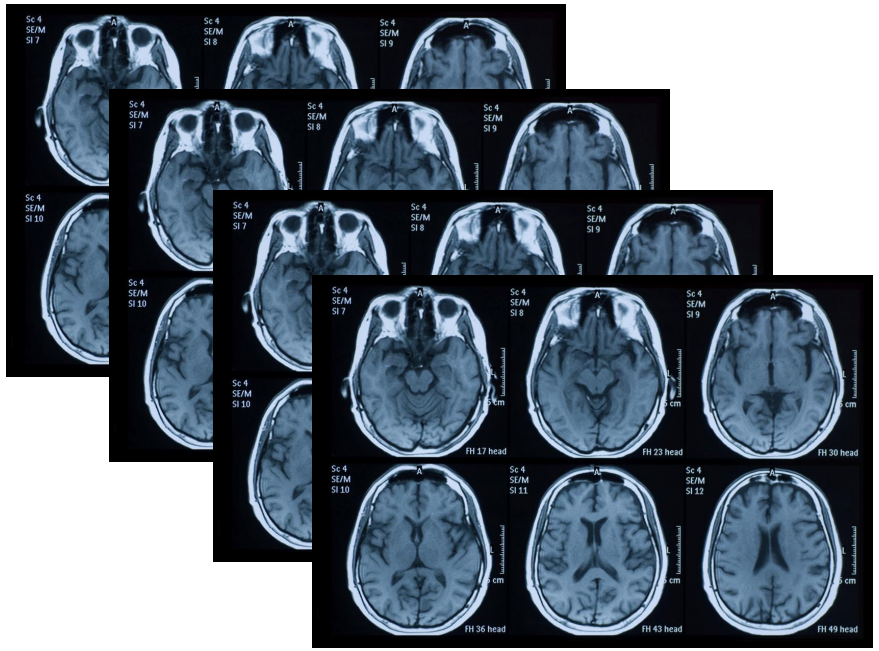
Why do we care?

- Run many independent jobs...
  - analyze multiple data files
  - test parameter or input combinations
  - and more!



Why do we care?

- Run many independent jobs...
  - analyze multiple data files
  - test parameter or input combinations
  - and more!
- ...without having to:
  - start each job individually
  - create separate submit files for each job



Many Jobs, One Submit File

- HTCondor has built-in ways to submit multiple independent jobs with one submit file.

Photo by Joanna Kosinska on Unsplash

See Rachel Lombardi's talk next: Organizing and Submitting HTC Workloads

Numbered Input Files

- Goal: create 3 jobs that each analyze a different input file.

job.submit

```
executable = analyze.exe
arguments = file0.in file0.out
transfer_input_files = file0.in

log = job.log
output = job.out
error = job.err

queue
```

(submit_dir)/

```
analyze.exe
file0.in
file1.in
file2.in

job.submit
```

Multiple Jobs, No Variation

- This file generates 3 jobs, but doesn't use multiple inputs and will overwrite outputs

job.submit

```
executable = analyze.exe
arguments = file0.in file0.out
transfer_input_files = file0.in

log = job.log
output = job.out
error = job.err

queue 3
```

(submit_dir)/

```
analyze.exe
file0.in
file1.in
file2.in

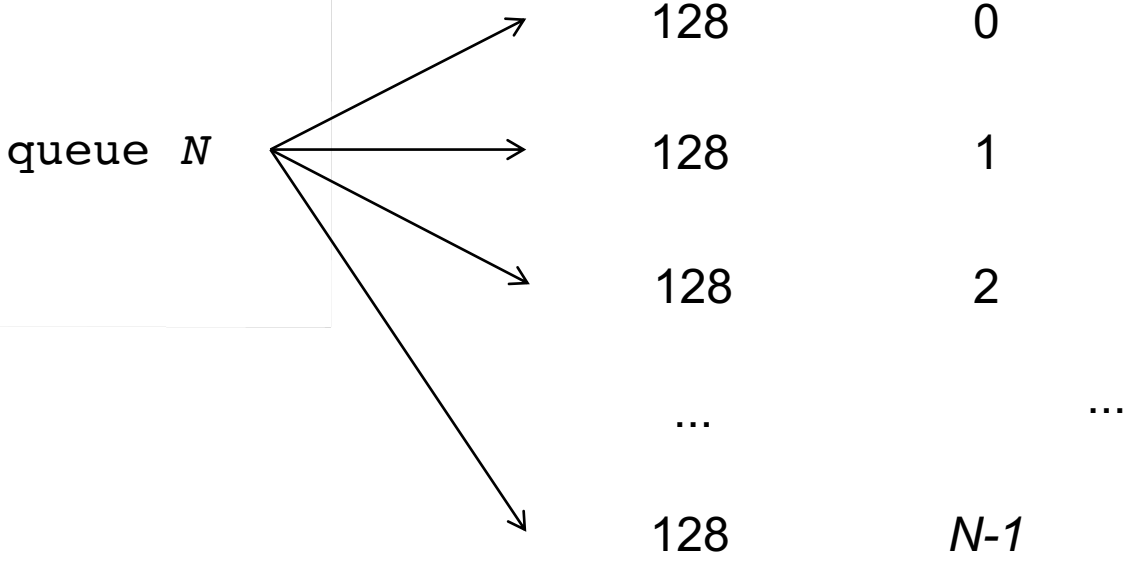
job.submit
```

Automatic Variables

- Each job's `ClusterId` and `ProcId` can be accessed inside the submit file using:

```
$(ClusterId)

$(ProcId)
```



Job Variation

- How to uniquely identify each job (filenames, log/out/err names)?

job.submit

```
executable = analyze.exe
arguments = file0.in file0.out
transfer_input_files = file0.in

log = job.log
output = job.out
error = job.err

queue 3
```

(submit_dir)/

```
analyze.exe
file0.in
file1.in
file2.in

job.submit
```

Using $(ProcId)

- Use the `$(ClusterId)`, `$(ProcId)` variables to provide unique values to jobs.*

job.submit

```
executable = analyze.exe
arguments = file$(ProcId).in file$(ProcId).out
transfer_input_files = file$(ProcId).in

log = job-$(ClusterId)-$(ProcId).log
output = job-$(ClusterId)-$(ProcId).out
error = job-$(ClusterId)-$(ProcId).err

queue 3
```

(submit_dir)/

```
analyze.exe
file0.in
file1.in
file2.in

job.submit
```

* May also see `$(Cluster)`, `$(Process)` in documentation

Submit and Monitor (review)

`condor_submit submit_file_name`

`condor_q`

[HTCondor Manual: condor_submit]
[HTCondor Manual: condor_q]

- Jobs in the queue will be grouped in batches (in this case by cluster number)

```
$ condor_submit job.submit
Submitting job(s).
3 job(s) submitted to cluster 128.
```

```
$ condor_q
-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?... @ 05/09/19 10:35:54
OWNER  BATCH_NAME    SUBMITTED    DONE       RUN    IDLE  TOTAL JOB_IDS
alice  ID: 128      5/9  11:03      _      _      3      3      128.0-2

3 jobs; 0 completed, 0 removed, 3 idle, 0 running, 0 held, 0 suspended
```

Using Batches

- Alternatively, batches can be grouped manually using the `JobBatchName` attribute in a submit file:

```
JobBatchName = "CoolJobs"
```

```
$ condor_q
OWNER  BATCH_NAME     SUBMITTED   DONE   RUN    IDLE  TOTAL JOB_IDS
alice  CoolJobs       5/9  11:03     _      _      3      3 128.0-2
```

- To see individual jobs, use:

`condor_q -nobatch`

Organizing Jobs

```
12181445_0.err  16058473_0.err  17381628_0.err  18159900_0.err  5175744_0.err  7266263_0.err
12181445_0.log  16058473_0.log  17381628_0.log  18159900_0.log  5175744_0.log  7266263_0.log
12181445_0.out  16058473_0.out  17381628_0.out  18159900_0.out  5175744_0.out  7266263_0.out
13609567_0.err  16060330_0.err  17381640_0.err  3446080_0.err   5176204_0.err  7266267_0.err
13609567_0.log  16060330_0.log  17381640_0.log  3446080_0.log   5176204_0.log  7266267_0.log
13609567_0.out  16060330_0.out  17381640_0.out  3446080_0.out   5176204_0.out  7266267_0.out
13612268_0.err  16254074_0.err  17381665_0.err  3446306_0.err   5295132_0.err  7937420_0.err
13612268_0.log  16254074_0.log  17381665_0.log  3446306_0.log   5295132_0.log  7937420_0.log
13612268_0.out  16254074_0.out  17381665_0.out  3446306_0.out   5295132_0.out  7937420_0.out
13630381_0.err  17134215_0.err  17381676_0.err  4347054_0.err   5318339_0.err  8779997_0.err
```

Shared Files

- HTCondor can transfer an entire directory or all the contents of a directory
  - transfer whole directory

```
transfer_input_files = shared
```

  - transfer contents only

```
transfer_input_files = shared/
```

- Useful for jobs with many shared files; transfer a directory of files instead of listing files individually

```
(submit_dir)/
    job.submit
    shared/
        reference.db
        parse.py
        analyze.py
        cleanup.py
        links.config
```

Shared Files

- HTCondor can transfer an entire directory or all the contents of a directory
  - transfer whole directory

```
transfer_input_files = shared
```

  - transfer contents only

```
transfer_input_files = shared/
```

- Useful for jobs with many shared files; transfer a directory of files instead of listing files individually

```
(submit_dir)/
    job.submit
    shared/
        reference.db
        parse.py
        analyze.py
        cleanup.py
        links.config
```

Use Sub-Directories for File Type

- Create sub-directories* and use paths in the submit file to separate input, error, log, and output files.

job.submit

```
executable = analyze.exe
arguments = file$(Process).in file$(ProcId).out
transfer_input_files = input/file$(ProcId).in

log = log/job$(ProcId).log

queue 3
```

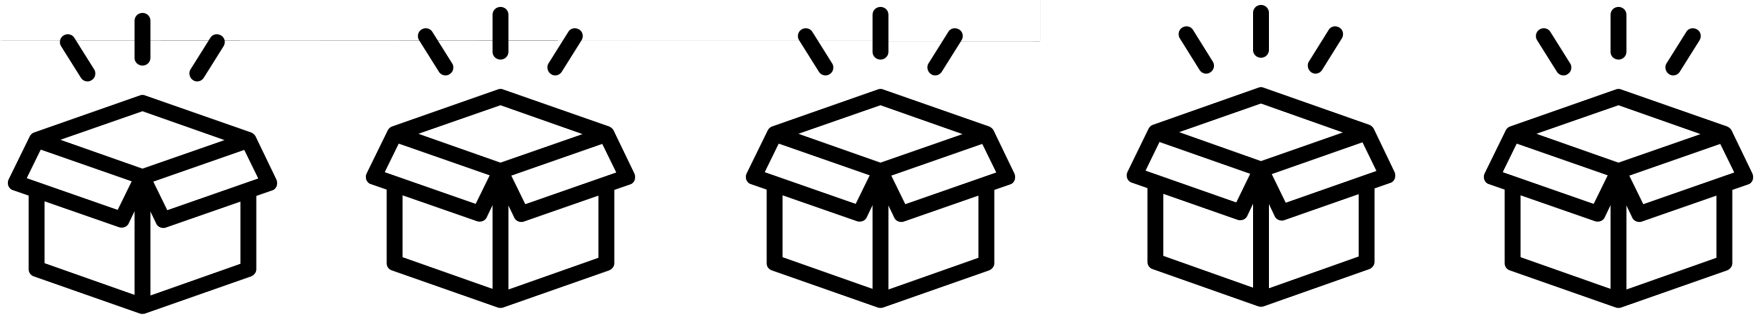
(submit_dir)/

```
job.submit
analyze.exe
file0.out
file1.out
file2.out
input/
  file0.in
  file1.in
  file2.in
log/
  job0.log
  job1.log
  job2.log
```

* must be created before the job is submitted

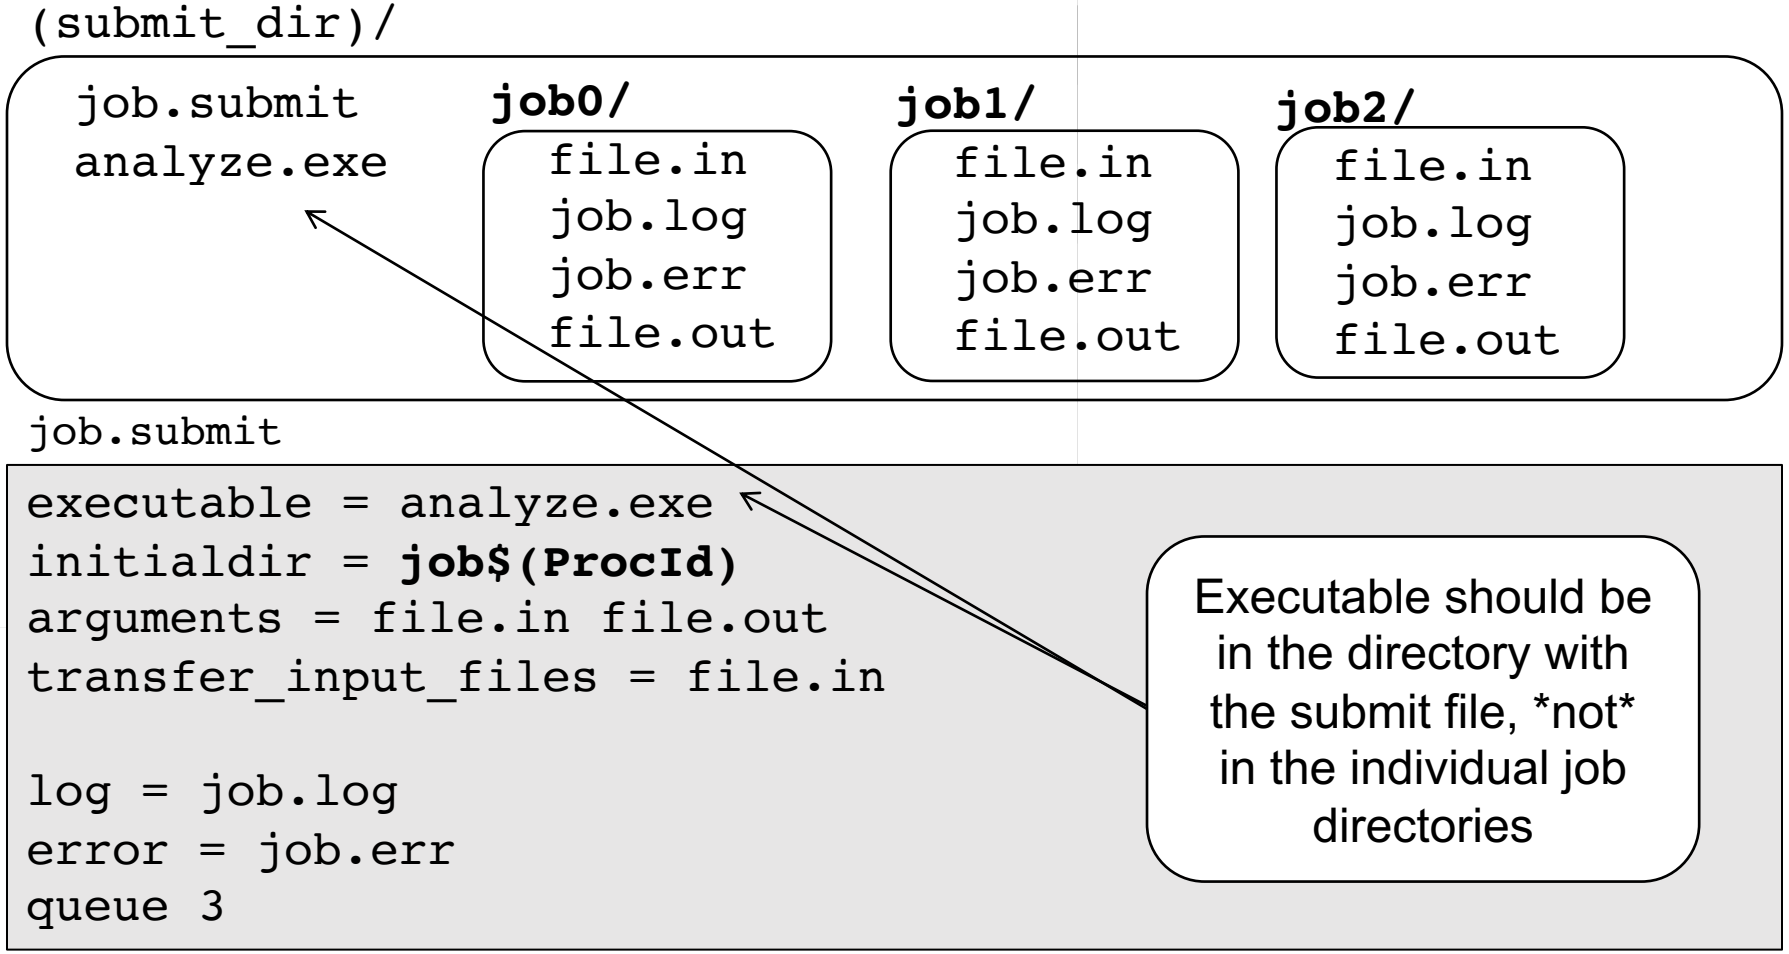
One Job per Directory

- Change the submission directory for each job using `initialdir`
- Allows the user to organize job files into separate directories.
- Use the same name for all input/output files
- Useful for jobs with lots of output files



Box by Alice Design from the Noun Project

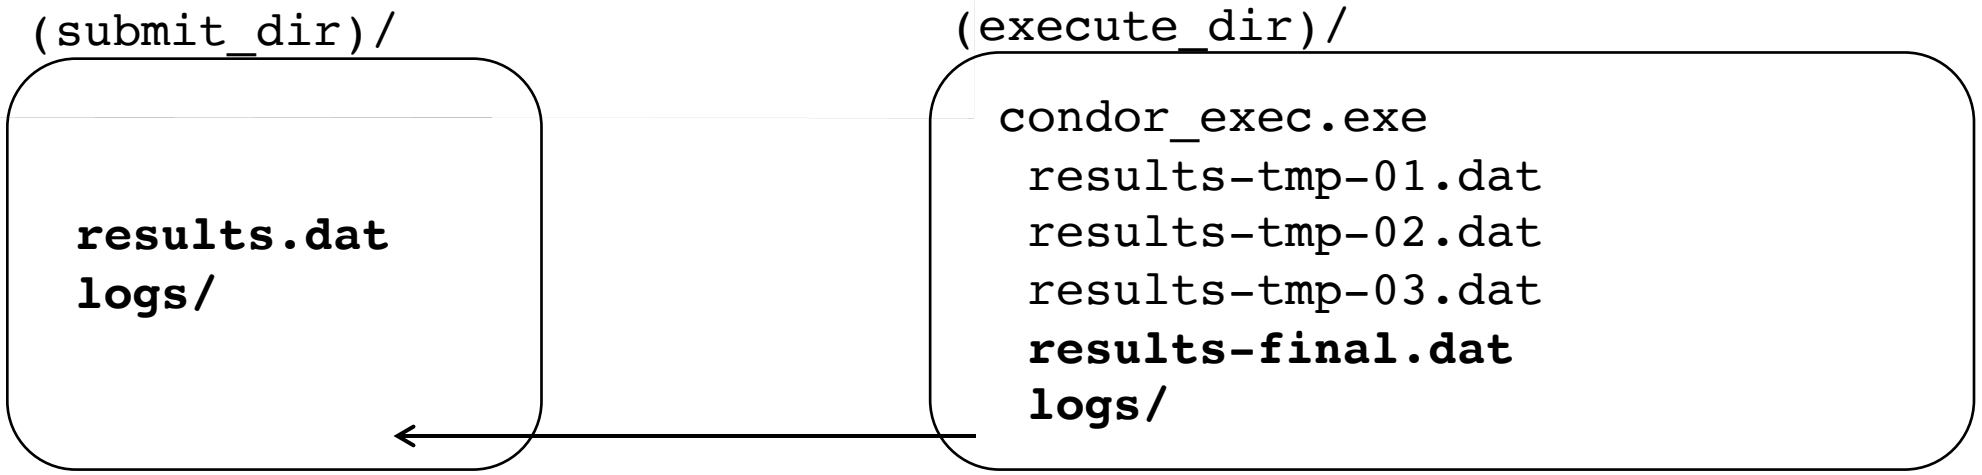
Separate Jobs with `InitialDir`



Output Handling

- Only transfer back specific files or directories from the job's execution using `transfer_ouput_files`
- rename with `transfer_output_remaps`

```
transfer_output_files = results-final.dat, logs
transfer_output_remaps = "results-final.dat=results.dat"
```



Other Submission Methods

- What if your input files/directories aren't numbered from `0` to `(N-1)`?
- There are other ways to submit many jobs!

Photo by Andrew Toskin on Flickr, CC-BY-SA

Submitting Multiple Jobs

Replacing single job inputs…

```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

transfer_input_files = us.dat, wi.dat

queue 1
```

…with a variable of choice.

```
executable = compare_states
arguments = $(infile) us.dat $(infile).out

transfer_input_files = us.dat, $(infile)

queue ...
```

Possible Queue Statements

matching ... pattern	`queue infile matching *.dat`
in ... list	`queue infile in (wi.dat ca.dat ia.dat)`
from ... file	`queue infile from state_list.txt`

```
wi.dat
ca.dat
ia.dat
```

state_list.txt

Queue Statement Comparison

matching .. pattern	Natural nested looping, minimal programming, use optional “files” and “dirs” keywords to only match files or directories Requires good naming conventions,
in .. list	Supports multiple variables, all information contained in a single file, reproducible Harder to automate submit file creation
from .. file	Supports multiple variables, highly modular (easy to use one submit file for many job batches), reproducible Additional file needed

Using Multiple Variables

- The "from" syntax supports using multiple variables from a list.

job.submit

```
executable = compare_states
arguments = -y $(option) -i $(file)

should_transfer_files = YES
when_to_transfer_output = ON_EXIT
transfer_input_files = $(file)

queue file,option from job_list.txt
```

job_list.txt

```
wi.dat, 2010
wi.dat, 2015
ca.dat, 2010
ca.dat, 2015
ia.dat, 2010
ia.dat, 2015
```

Other Features

- Match existing files or directories:

```
queue input matching files *.dat
```

```
queue directory matching dirs job*
```

- Submit multiple jobs with same input data

```
queue 10 input matching files *.dat
```

  - Use other automatic variables: `$(Step)`

```
arguments = -i $(input) -rep $(Step)
queue 10 input matching files *.dat
```

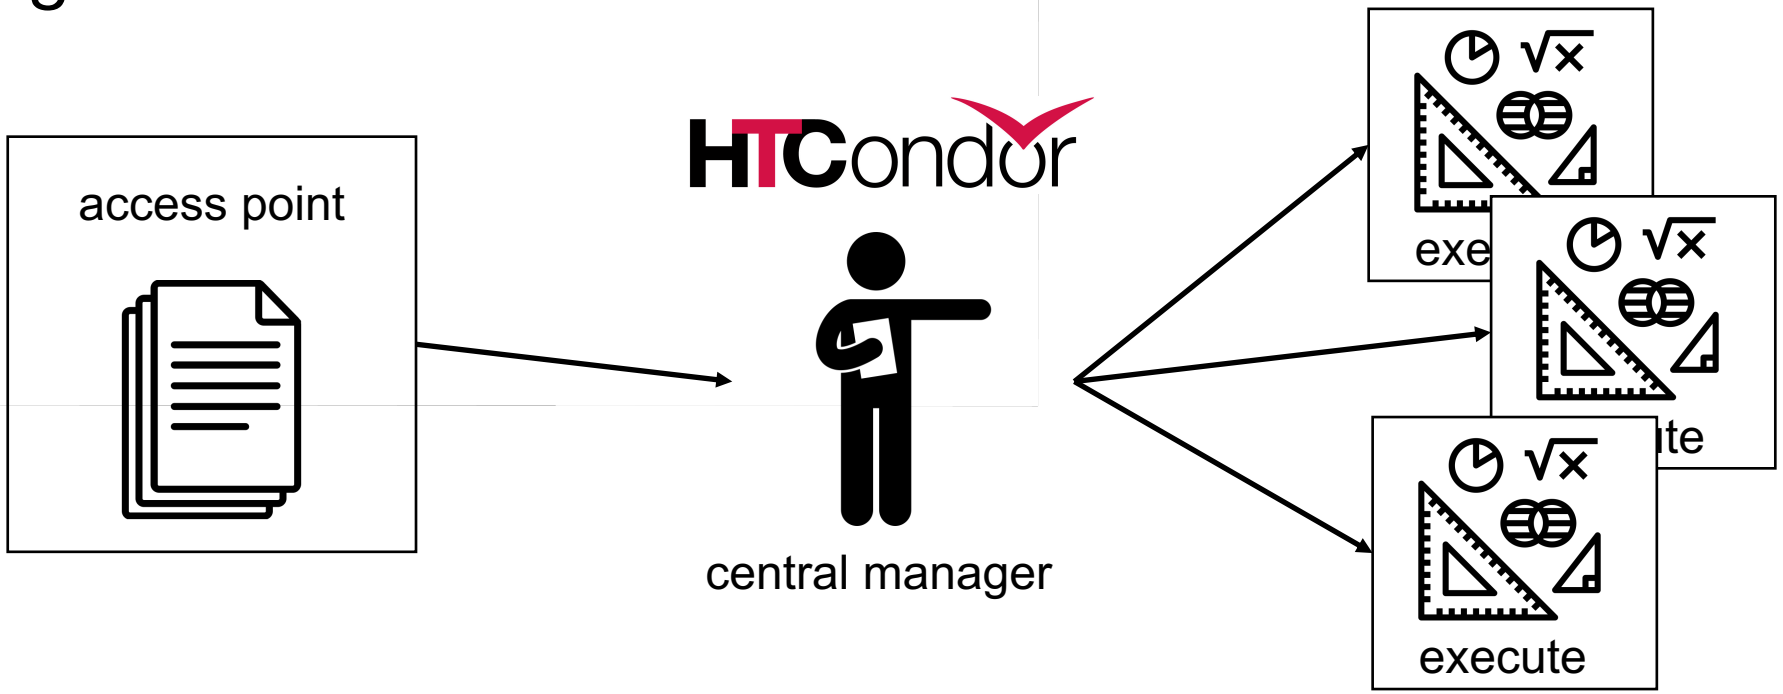
(60 second) Pause

Questions so far?

Job Matching and Class Ad Attributes

The Central Manager

- HTCondor matches jobs with computers via a “central manager”.



manager by Gan Khoon Lay from the Noun Project

Class Ads

- HTCondor stores a list of information about each job and each computer.
- This information is stored as a “Class Ad”
- Class Ads have the format:
  - `AttributeName = value`

can be a boolean, number, or string

Photo by Wherda Arsianto on Unsplash

HTCondor Manual: Appendix A: Class Ad Attributes

Job Class Ad

```
executable = compare_states
arguments = wi.dat us.dat wi.dat.out

should_transfer_files = YES
transfer_input_files = us.dat, wi.dat
when_to_transfer_output = ON_EXIT

log = job.log
output = job.out
error = job.err

request_cpus = 1
request_disk = 20MB
request_memory = 20MB

queue 1
```

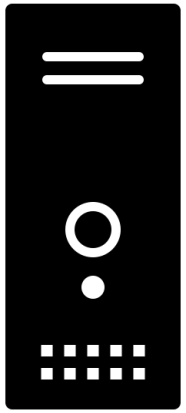
+

HTCondor configuration*

=>

```
RequestCpus = 1
Err = "job.err"
WhenToTransferOutput = "ON_EXIT"
TargetType = "Machine"
Cmd = "/home/alice/compare_states"
JobUniverse = 5
Iwd = "/home/alice/tests/htcondor_week"
RequestDisk = 20480
NumJobStarts = 0
TransferInput = "us.dat,wi.dat"
Out = "job.out"
UserLog = "/home/alice/job.log"
RequestMemory = 20
...
```

Computer “Machine” Class Ad



+

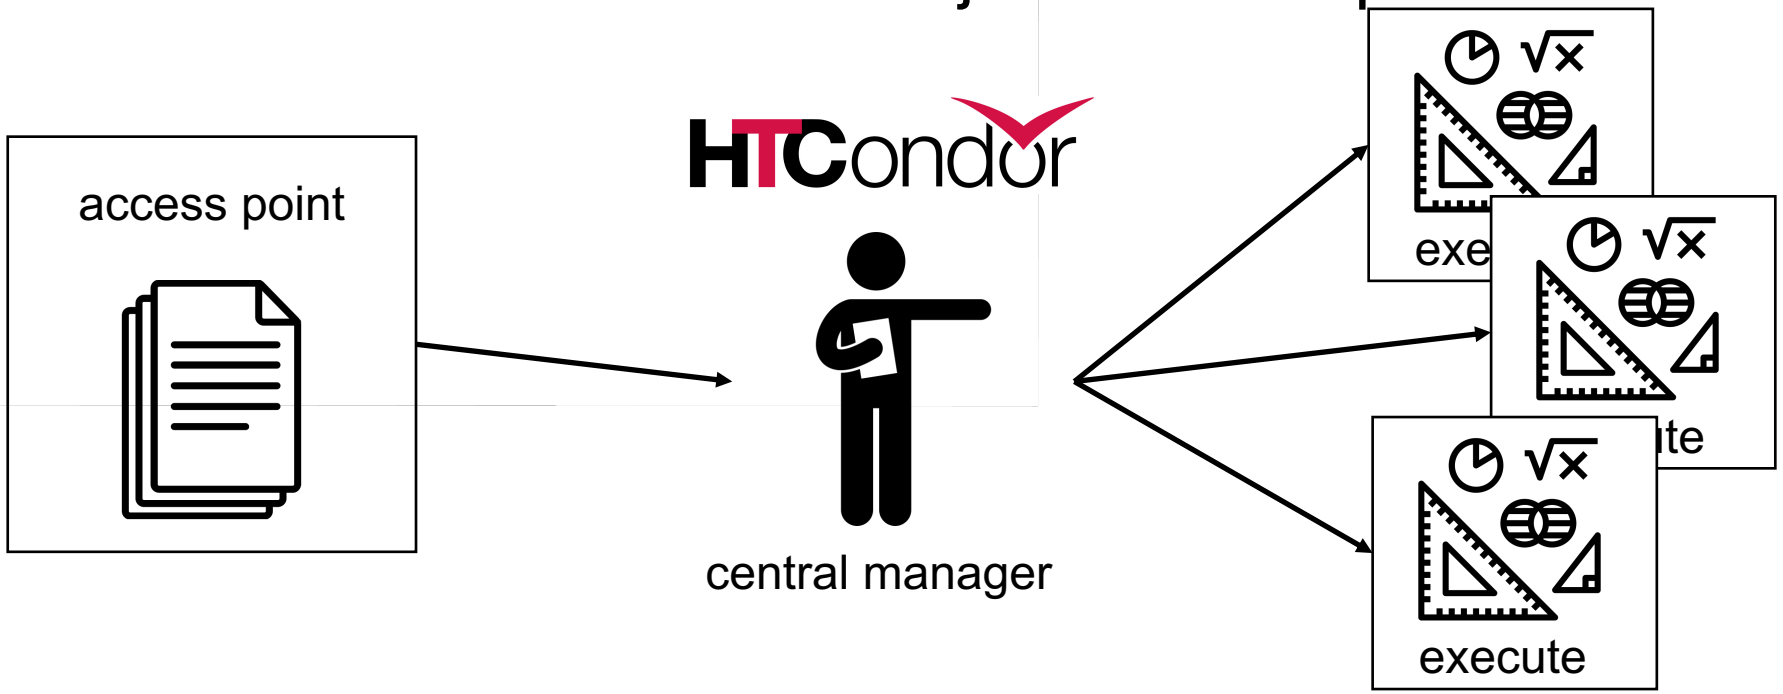
HTCondor configuration

=>

```
HasFileTransfer = true
DynamicSlot = true
TotalSlotDisk = 4300218.0
TargetType = "Job"
TotalSlotMemory = 2048
Mips = 17902
Memory = 2048
UtsnameSysname = "Linux"
MAX_PREEMPT = ( 3600 * 72 )
OpSysMajorVer = 6
TotalMemory = 9889
OpSysName = "SL"
HasDocker = true
...
```

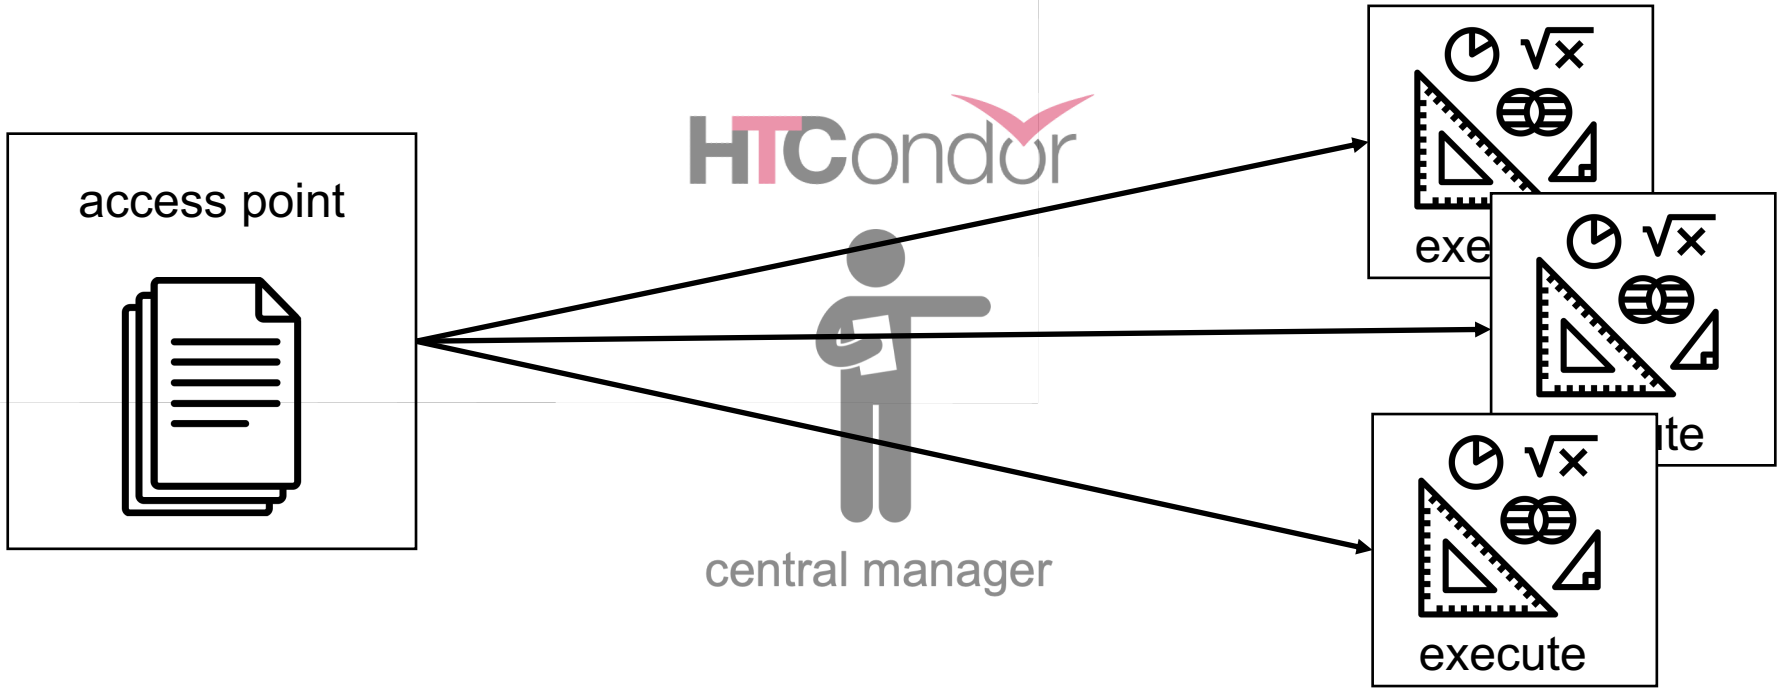
Job Matching

- On a regular basis, the central manager reviews Job and Machine Class Ads and matches jobs to computers.



Job Execution

- (Then the access and execute points communicate directly.)



Class Ads for People

- Class Ads also provide lots of useful information about jobs and computers to HTCondor users and administrators

Photo by Roman Kraft on Unsplash

See later talk: What Are My Jobs Doing?

Finding Job Attributes

- Use the “long” option for **`condor_q`**

  `condor_q -l` ***`JobId`***

```
$ condor_q -l 128.0
WhenToTransferOutput = "ON_EXIT"
TargetType = "Machine"
Cmd = "/home/alice/tests/htcondor_week/compare_states"
JobUniverse = 5
Iwd = "/home/alice/tests/htcondor_week"
RequestDisk = 20480
NumJobStarts = 0
OnExitRemove = true
TransferInput = "us.dat,wi.dat"
UserLog = "/home/alice/tests/htcondor_week/job.log"
RequestMemory = 20
...
```

Displaying Job Attributes

- Use the “auto-format” option:

condor_q [U/C/J] **-af** ***Attribute1 Attribute2 ...***

```
$ condor_q -af ClusterId ProcId RemoteHost MemoryUsage

1725 116 slot1_1@e092.chtc.wisc.edu 1709
1725 118 slot1_2@e093.chtc.wisc.edu 1709
1725 137 slot1_8@e125.chtc.wisc.edu 1709
1725 139 slot1_7@e121.chtc.wisc.edu 1709
1861 0 slot1_5@c025.chtc.wisc.edu 196
1863 0 slot1_3@atlas10.chtc.wisc.edu 269
1864 0 slot1_25@e348.chtc.wisc.edu 245
1865 0 slot1_23@e305.chtc.wisc.edu 196
```

Selecting Job Attributes

- Use the "constraint" option, along with an expression for what jobs you want to look at:

condor_q [U/C/J] -constraint '*Attribute >/</== value*'

```
$ condor_q -constraint 'JobBatchName == "CoolJobs"'

OWNER  BATCH_NAME      SUBMITTED   DONE   RUN    IDLE  TOTAL JOB_IDS
alice  CoolJobs       5/9  11:03     _      _      3      3 128.0-2
```

Other Displays

- See the whole queue (all users, all jobs)

  condor_q -all

```
$ condor_q -all

-- Schedd: submit-1.chtc.wisc.edu : <128.104.101.92:9618?...
OWNER    BATCH_NAME    SUBMITTED   DONE   RUN    IDLE   HOLD  TOTAL JOB_IDS
alice    DAG: 128      5/9  02:52    982      2       _      _   1000 18888976.0 ...
bob      DAG: 139      5/9  09:21      _      1      89      _    180 18910071.0 ...
alice    DAG: 219      5/9  10:31      1    997       2      _   1000 18911030.0 ...
bob      DAG: 226      5/9  10:51     10      _       1      _     44 18913051.0
bob      CMD: ce.sh    5/9  10:55      _      _       _      2      _ 18913029.0 ...
alice    CMD: sb       5/9  10:57      _      2     998      _      _ 18913030.0-999
```

Class Ads for Computers

- as **`condor_q`** is to jobs, **`condor_status`** is to computers (or “machines”)

```
$ condor_status

```

HTCondor Manual: condor_status

Find Machine Attributes

- Use same options as **`condor_q:`** to get attributes for a specific machine, use:

  `condor_status -l` ***`Slot/Machine`***

```
$ condor_status -l slot1_1@c001.chtc.wisc.edu
HasFileTransfer = true
COLLECTOR_HOST_STRING = "cm.chtc.wisc.edu”
TotalTimeClaimedBusy = 43334c001.chtc.wisc.edu
Mips = 17902
MAX_PREEMPT = ( 3600 * ( 72 - 68 * ( WantGlidein =?= true ) ) )
Requirements = ( START ) && ( IsValidCheckpointPlatform ) && ( WithinResourceLimits )
State = "Claimed"
OpSysMajorVer = 6
OpSysName = "SL”
...
```

Useful Machine Attributes

- **`Machine, Name`**: name of the server, or slot
- **`Cpus, Memory, Disk`**: resources on that server
- **`GPUs, GPUs_DeviceName`**: number and type of GPUs
- **`RemoteOwner`**: Who is running
- **`CPUModel`**: type of CPU
- ...and more (see the manual)

Display Machine Attributes

- Use same options as **`condor_q`**, part 2, to display attributes, use

  `condor_status` **`[Machine] -af`** ***`Attribute1 Attribute2 ...`***

```
$ condor_status e000.chtc.wisc.edu –af Name CPUs Memory Disk HasCHTCStaging
slot1@e1013.chtc.wisc.edu 1 80116 82285091 false
slot1_1@e1013.chtc.wisc.edu 1 768 12992383 false
slot1_2@e1013.chtc.wisc.edu 2 1536 1332553 false
slot1_3@e1013.chtc.wisc.edu 1 768 12992383 false
slot1_4@e1013.chtc.wisc.edu 2 1536 1332553 false
slot1_5@e1013.chtc.wisc.edu 2 1536 1332553 false
slot1_7@e1013.chtc.wisc.edu 2 1536 1332553 false
slot1_8@e1013.chtc.wisc.edu 1 2048 2331967 false
slot1_9@e1013.chtc.wisc.edu 2 1536 1332553 false
```

Machine Attributes

- To summarize, use the "-compact" option

`condor_status -compact`

```
$ condor_status -compact
Machine                      Platform     Slots Cpus Gpus  TotalGb FreCpu  FreeGb  CpuLoad ST
e007.chtc.wisc.edu           x64/SL6          8    8          23.46      0     0.00    1.24 Cb

```

Testing and Troubleshooting

What Can Go Wrong?

- Jobs can go wrong “internally”:
  - something happens after the executable begins to run
- Jobs can go wrong from HTCondor’s perspective:
  - A job can’t be started at all,
  - Uses too much memory,
  - Has a badly formatted executable,
  - And more...

“Live” Troubleshooting

- To log in to a job where it is running, use:

  `condor_ssh_to_job JobId`

```
$ condor_ssh_to_job 128.0
Welcome to slot1_31@e395.chtc.wisc.edu!
Your condor job is running with pid(s) 3954839.
```

HTCondor Manual: condor_ssh_to_job

Reviewing Failed Jobs

- A job's log, output and error files can provide valuable information for troubleshooting

Log	Output	Error
• When jobs were submitted, started, and stopped • Resources used • Exit status • Where job ran • Interruption reasons	Any "print" or "display" information from your program	Captured by the operating system

Reviewing Recent Jobs

- To review a large group of jobs at once, use **`condor_history [U/C/J]`**
- As **`condor_q`** is to the present, **`condor_history`** is to the past

```
$ condor_history alice
 ID      OWNER    SUBMITTED   RUN_TIME    ST  COMPLETED   CMD
189.1012 alice    5/11 09:52   0+00:07:37 C   5/11 16:00 /home/alice
189.1002 alice    5/11 09:52   0+00:08:03 C   5/11 16:00 /home/alice
189.1081 alice    5/11 09:52   0+00:03:16 C   5/11 16:00 /home/alice
189.944  alice    5/11 09:52   0+00:11:15 C   5/11 16:00 /home/alice
189.659  alice    5/11 09:52   0+00:26:56 C   5/11 16:00 /home/alice
189.1003 alice    5/11 09:52   0+00:07:38 C   5/11 15:59 /home/alice
189.962  alice    5/11 09:52   0+00:09:36 C   5/11 15:59 /home/alice
189.898  alice    5/11 09:52   0+00:13:47 C   5/11 15:59 /home/alice
```

HTCondor Manual: condor_history

Held Jobs

- HTCondor will put your job on hold if there's something YOU need to fix.
- A job that goes on hold is interrupted (all progress is lost) and kept from running again, but remains in the queue in the "H" state.

Photo by Tim Gouw on Unsplash

```
$ condor_q -nobatch
ID     OWNER  SUBMITTED   RUN_TIME   ST PRI SIZE CMD
128.0  alice   5/9  11:09  0+00:00:00 H  0    0.0 analyze.exe

1 jobs; 0 completed, 0 removed, 0 idle, 0 running, 1 held, 0 suspended
```

Diagnosing Holds

- If HTCondor puts jobs on hold, it provides a hold reason, which can be viewed with:

```
condor_q -hold
```

```
$ condor_q -hold
ID     OWNER     HELD_SINCE  HOLD_REASON
125.0 bob       5/09 17:12  Error from slot1_1@wid-003.chtc.wisc.edu: Job has
  gone over memory limit of 2048 megabytes.
128.0 alice     5/11 12:06  Error from slot1_11@e138.chtc.wisc.edu: STARTER
  at 128.104.101.138 failed to send file(s) to <128.104.101.92:9618>; SHADOW at
  128.104.101.92 failed to write to file /home/alice/Test_18925319_16.err:
  (errno 122) Disk quota exceeded
131.0 bob       5/12 09:02  Error from slot1_38@e270.chtc.wisc.edu: Failed
  to execute '/var/lib/condor/execute/slot1/dir_2471876/condor_exec.exe' with
  arguments 2: (errno=2: 'No such file or directory')
```

Fixing Holds

- Job attributes can be edited while jobs are in the queue using:

  condor_qedit [U/C/J] Attribute Value

```
$ condor_qedit 128.0 RequestMemory 3072
Set attribute "RequestMemory".
```

- If a job has been fixed and can run again, release it with:

  condor_release [U/C/J]

```
$ condor_release 128.0
Job 18933774.0 released
```

HTCondor Manual: condor_qedit
HTCondor Manual: condor_release

Holding or Removing Jobs

- If you know your job has a problem and it hasn't yet completed, you can:
  - Place it on hold yourself, with **`condor_hold [U/C/J]`**

```
$ condor_hold bob
All jobs of user "bob" have been held
```

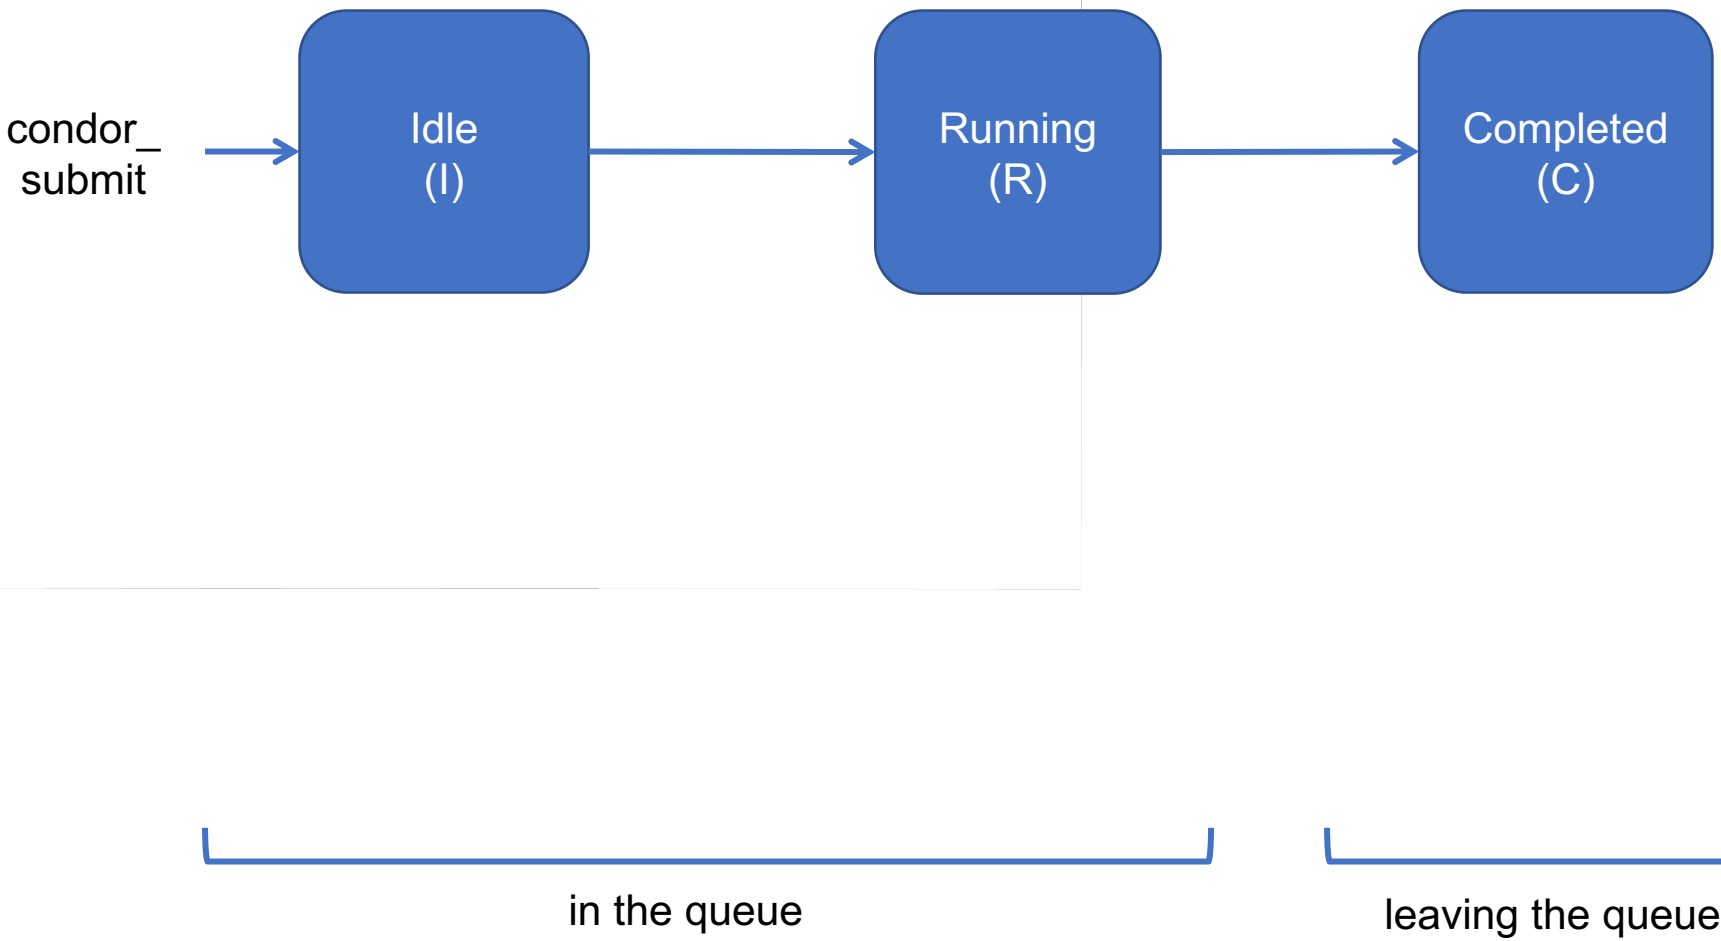
```
$ condor_hold 128
All jobs in cluster 128 have been held
```

```
$ condor_hold 128.0
Job 128.0 held
```

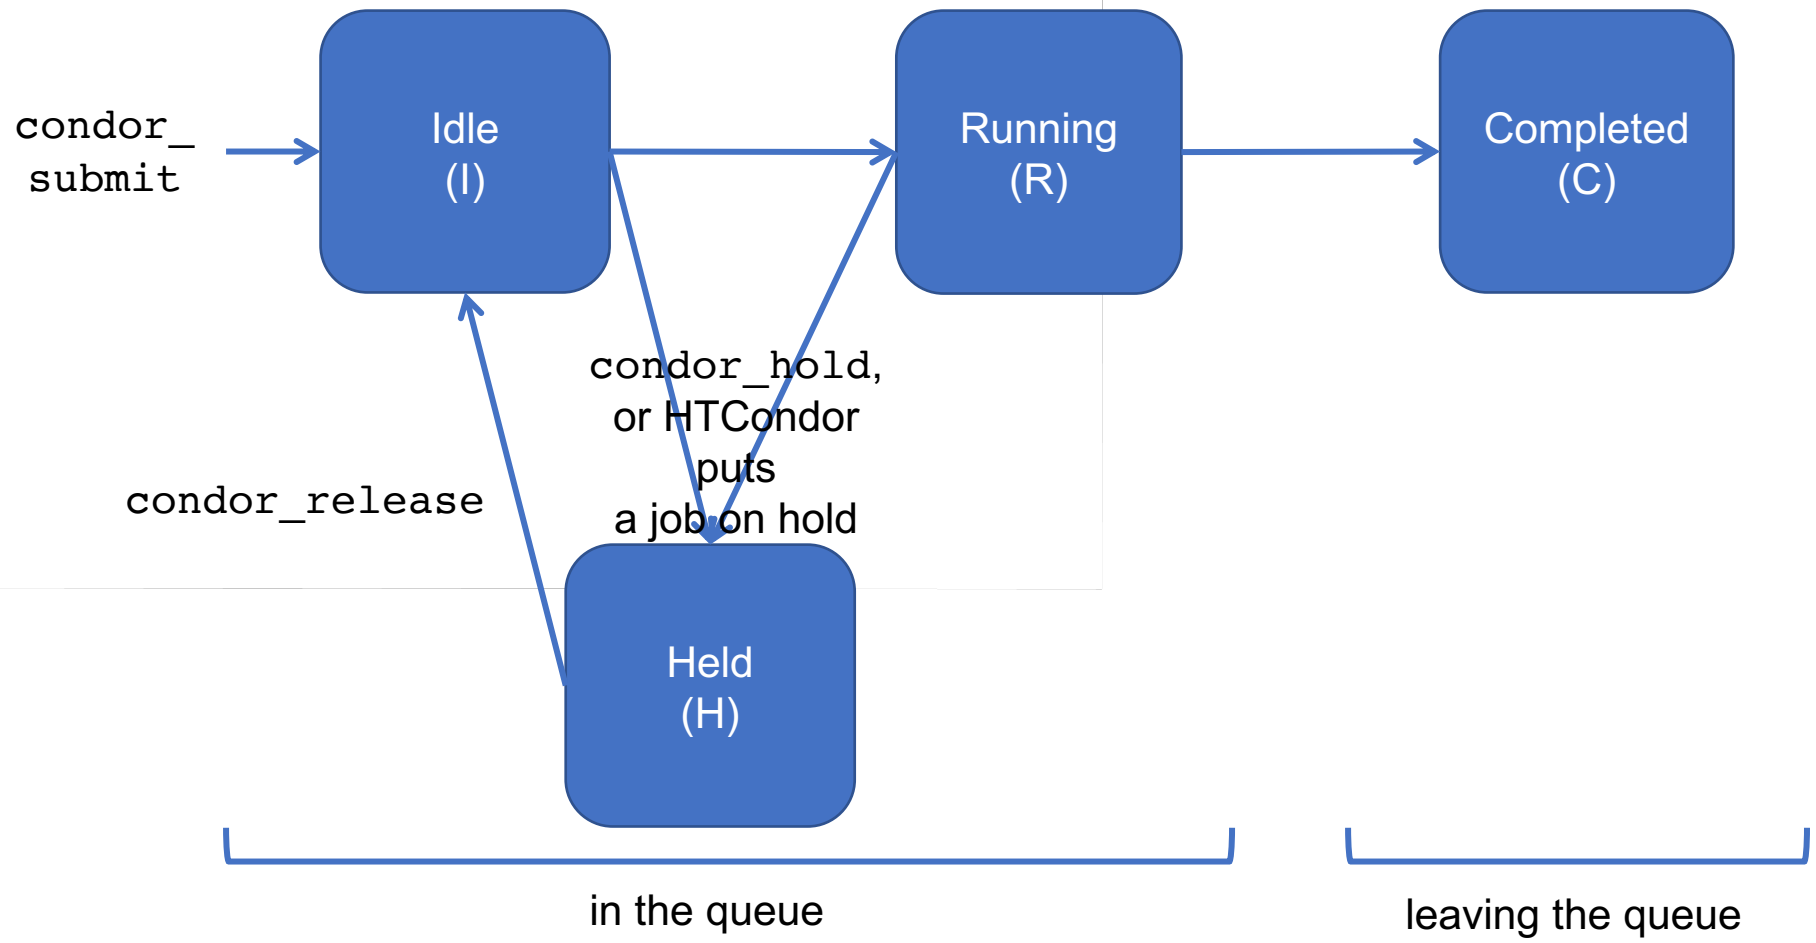
  - Remove it from the queue, using **`condor_rm [U/C/J]`**

HTCondor Manual: condor_hold
HTCondor Manual: condor_rm

Job States, Revisited

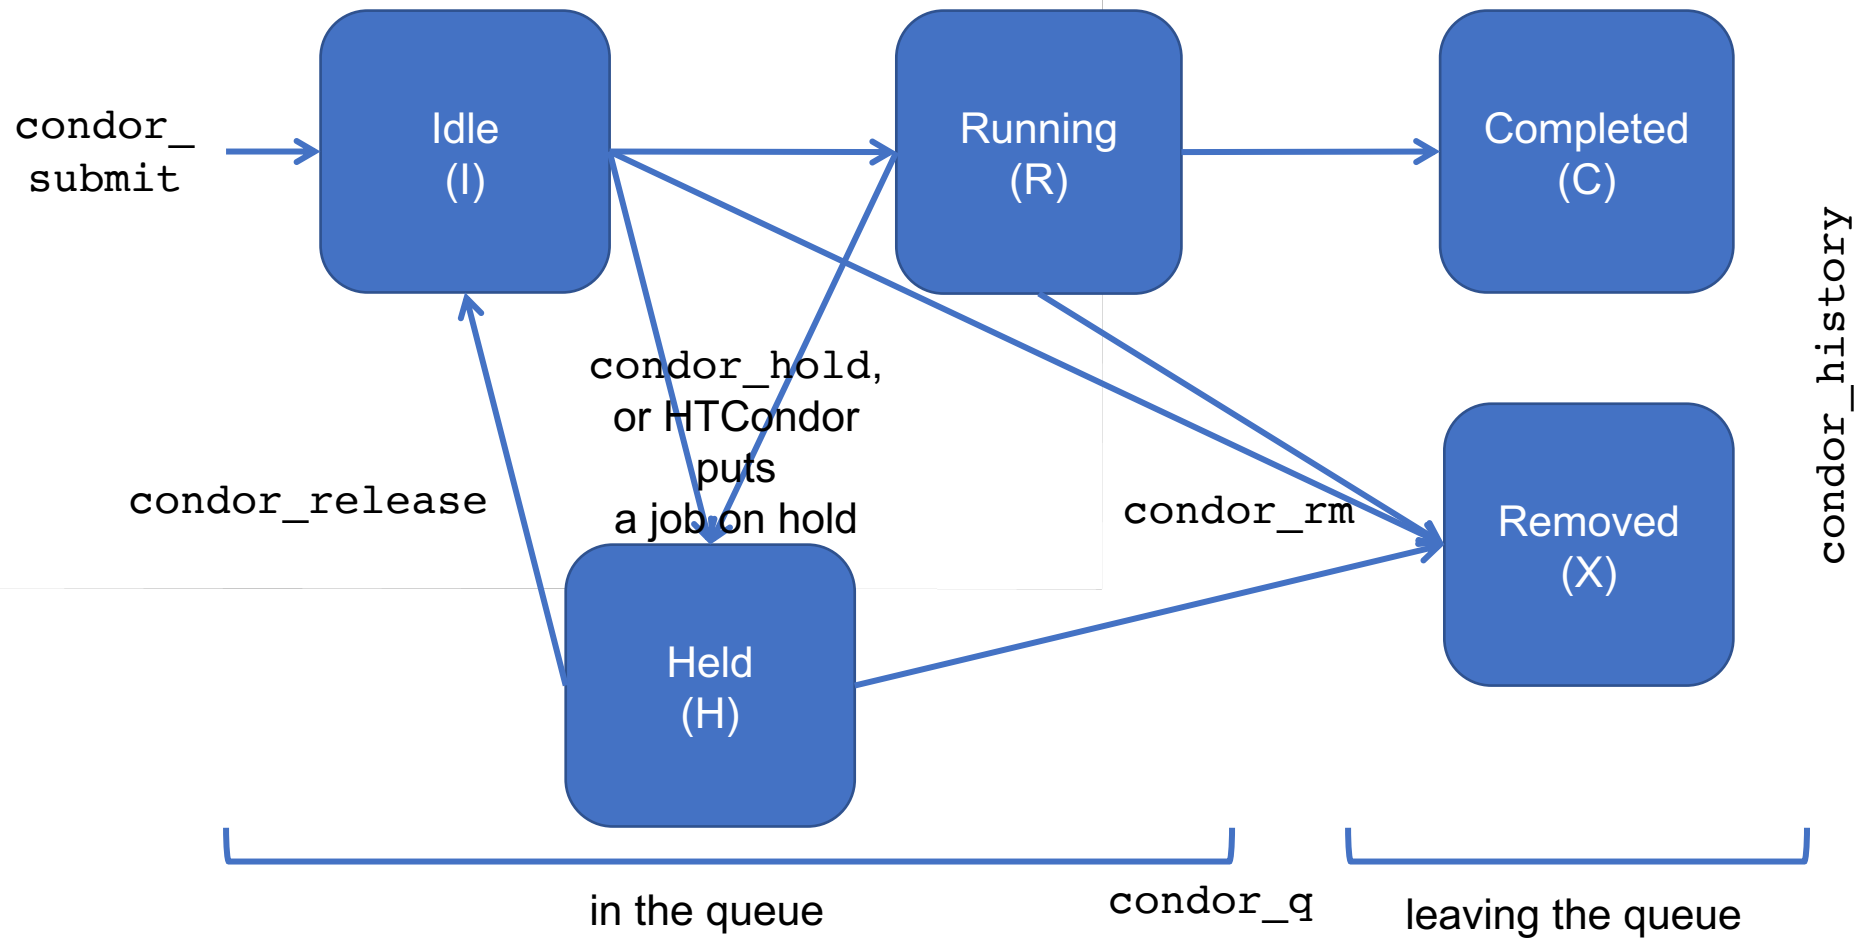


Job States, Revisited



Job States, Revisited*

*not comprehensive



Use Cases and HTCondor Features

Interactive Jobs

- An interactive job proceeds like a normal batch job, but opens a bash session into the job's execution directory instead of running an executable.

`condor_submit -i submit_file`

```
$ condor_submit -i interactive.submit
Submitting job(s).
1 job(s) submitted to cluster 18980881.
Waiting for job to start...
Welcome to slot1_9@e184.chtc.wisc.edu!
```

- Useful for testing and troubleshooting

Self-Checkpointing

- By default, a job that is interrupted will start from the beginning if it is restarted.
- It is possible to implement self-checkpointing, which will allow a job to restart from a saved state if interrupted.
- Self-checkpointing is useful for:
  - very long jobs
  - running on opportunistic resources.

Self-Checkpointing How-To

- Edit executable:
  - Regularly exit with a non-zero exit code, after saving intermediate states to a checkpoint file
  - Always check for a checkpoint file when starting
- Add HTCondor options that transfer checkpoint files back to the Access Point and then restarts the executable:

```
checkpoint_exit_code = 85
transfer_checkpoint_files = check.point
```

See Todd Miller's afternoon talk: Self-Checkpointing Jobs

Job Universes

- HTCondor has different “universes” for running specialized job types
  - HTCondor Manual: Choosing an HTCondor Universe
- Vanilla (default)
  - good for most software
  - HTCondor Manual: Vanilla Universe
  - Set in the submit file using:

```
universe = vanilla
```

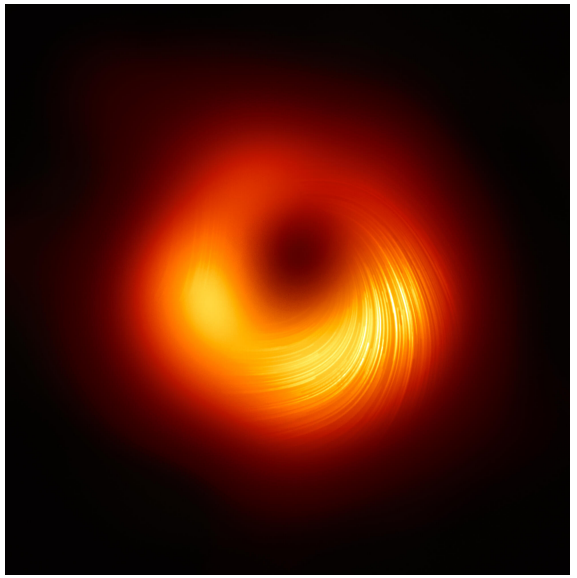


Image credit: EHT collaboration

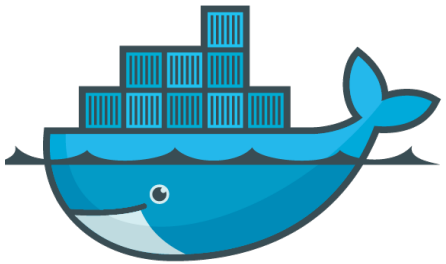
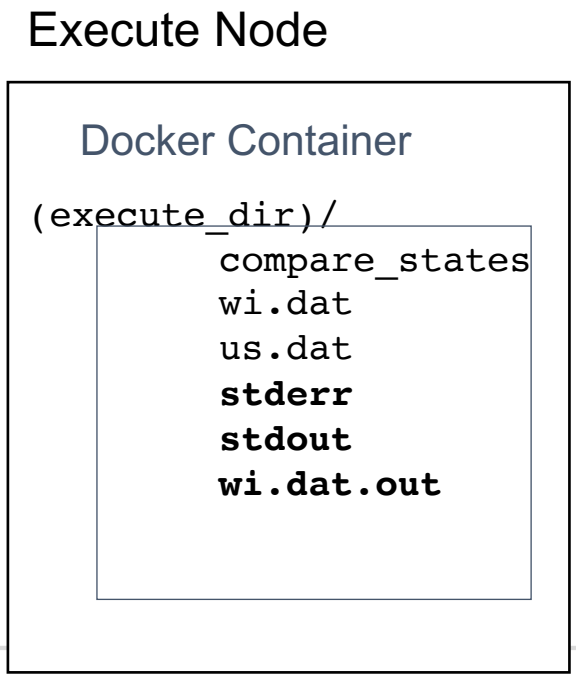
Docker Universe

- Use docker universe to
  - Run jobs inside a Docker container
  - HTCondor Manual: Docker Universe Applications



```
universe = docker
docker_image = ubuntu:trusty
# by default the docker image
# is pulled from DockerHub
```



Multi-CPU and GPU Computing

- Jobs that use multiple cores on a single computer can be run in the vanilla universe (parallel universe not needed):

```
request_cpus = 16
```

- If there are computers with GPUs, request them with:

```
request_gpus = 1
```

Automation

Automation

- After job submission, HTCondor manages jobs based on its configuration
- You can use options that will customize job management even further
- These options can automate when jobs are started, stopped, and removed.

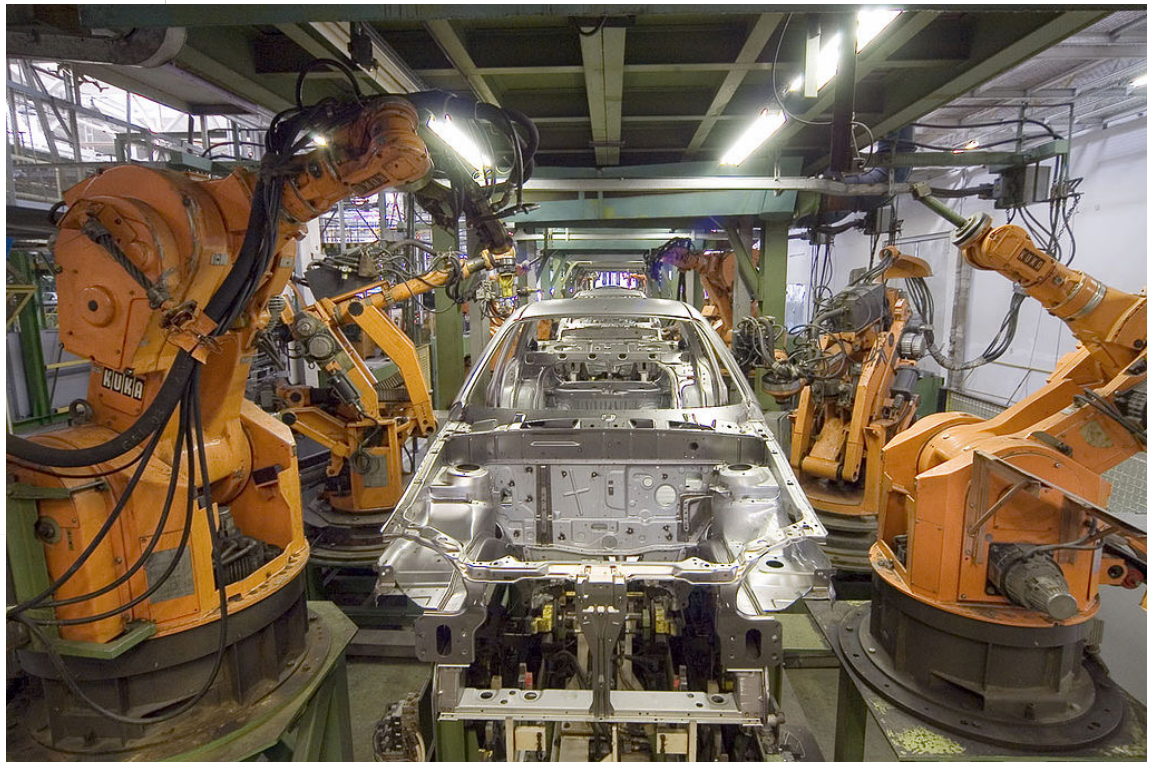


Photo by Mixabest on WikiMedia, CC-BY-SA

Retries

- **Problem**: a small number of jobs fail; if they run again, they complete successfully.
- **Solution**: If the job exits with an error, leave it in the queue to run again. This is done via the automatic option `max_retries`.

```
max_retries = 5
```

Limiting Jobs

- **Problem**: Submitting more than a few thousand jobs to the queue at once
- **Solution**: Use the `max_idle` option. This limits the number of jobs submitted at one time, but allows there to always be idle jobs ready to run.

```
max_idle = 1000
```

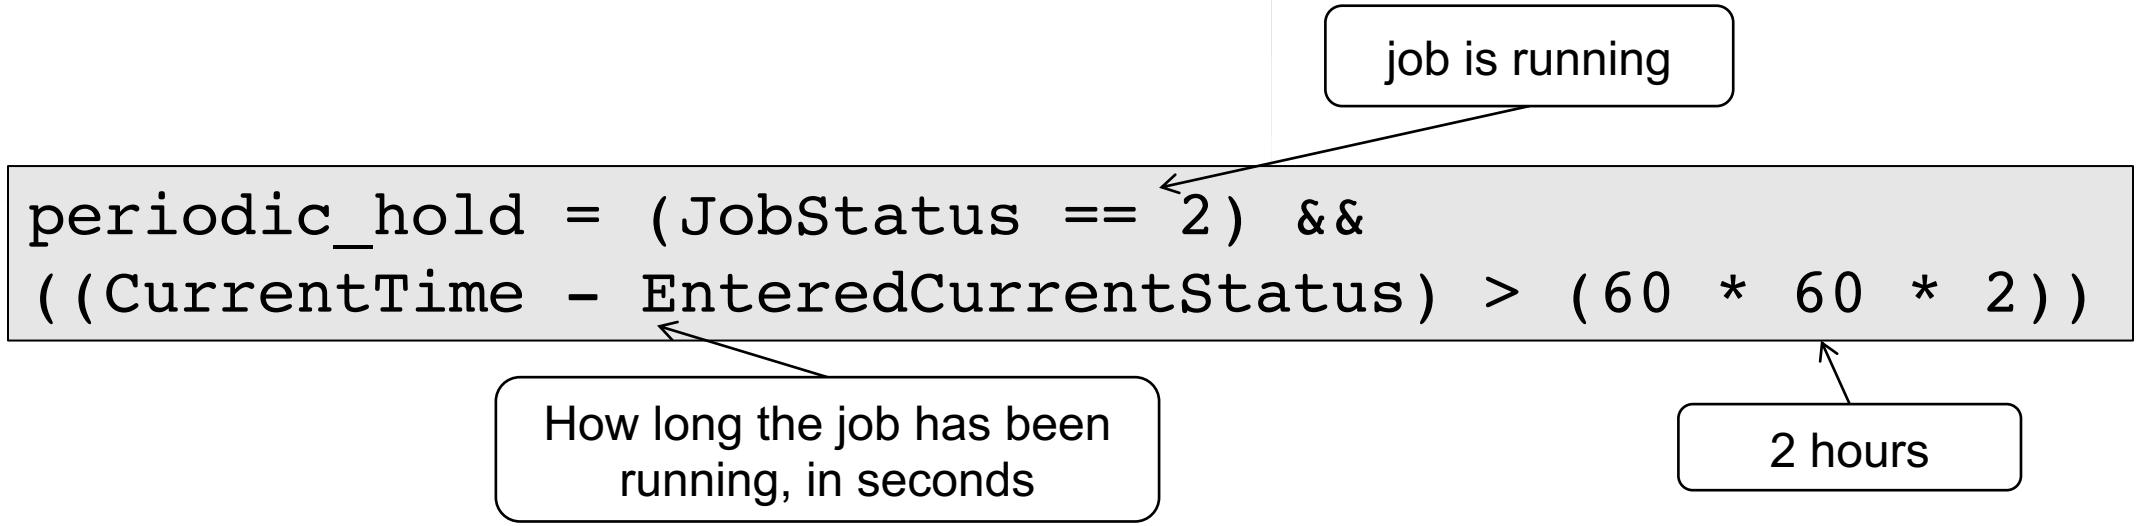
Useful Job Attributes for Automation

- `CurrentTime`: current time
- `EnteredCurrentStatus`: time of last status change
- `ExitCode`: the exit code from the job
- `HoldReasonCode`: number corresponding to a hold reason
- `NumJobStarts`: how many times the job has gone from idle to running
- `JobStatus`: number indicating idle, running, held, etc.

HTCondor Manual: Appendix A: JobStatus and HoldReason Codes

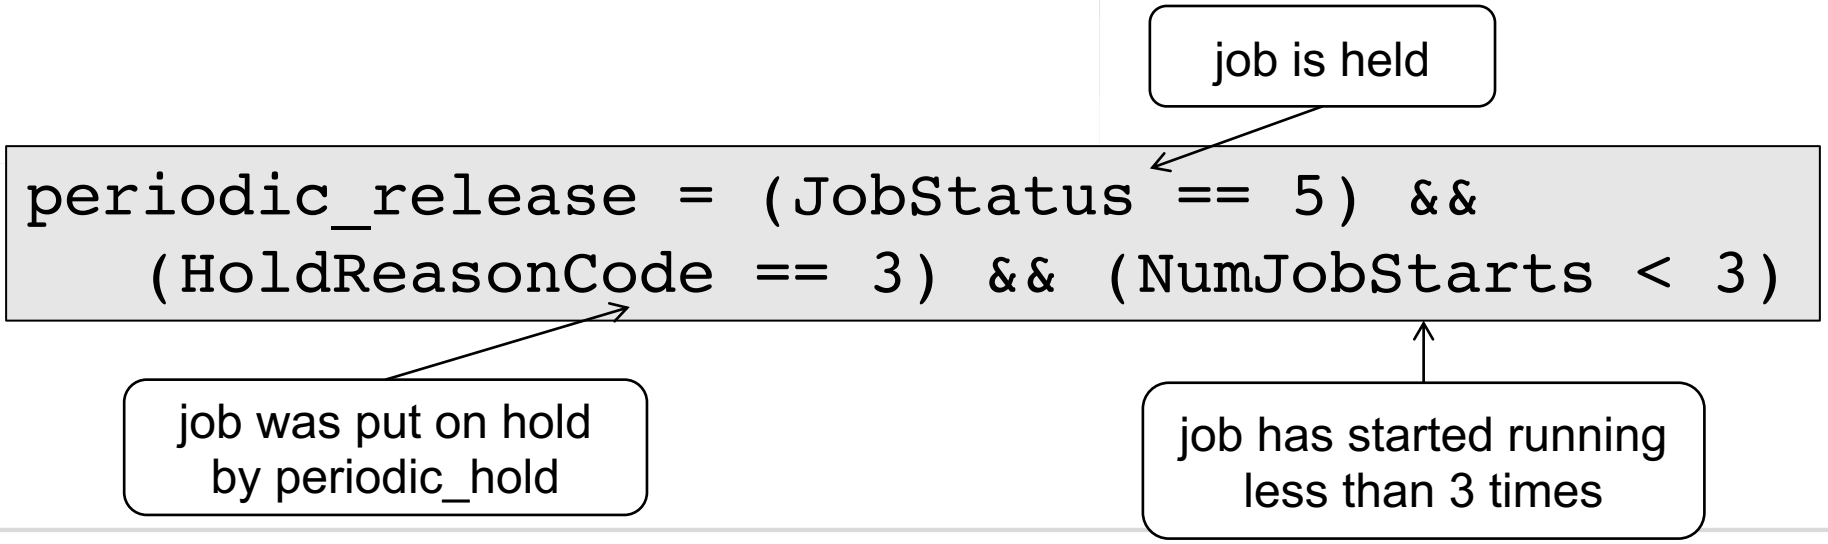
Automatically Hold Jobs

- **Problem**: Your job should run in 2 hours or less, but a few jobs "hang" randomly and run for days
- **Solution**: Put jobs on hold if they run for over 2 hours, using a `periodic_hold` statement



Automatically Release Jobs

- **Problem** (related to previous): A few jobs are being held for running long; they will complete if they run again.
- **Solution**: automatically release those held jobs with a `periodic_release` option, up to 3 times



Automatically Remove Jobs

- **Problem**: Jobs are repetitively failing
- **Solution**: Remove jobs from the queue using a `periodic_remove` statement

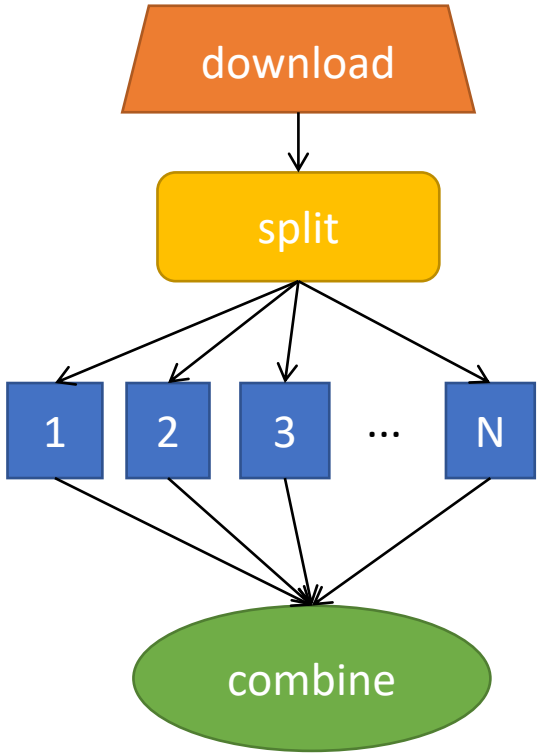
```
periodic_remove = (NumJobStarts > 5)
```

job has started running more than 5 times

Workflows

- **Problem**: Want to submit jobs in a particular order, with dependencies between groups of jobs
- **Solution**: Write a DAG

- To learn about this, stay for the later talk, DAGMan: HTCondor and Workflows by Lauren Michael.



Final Questions?
