

Muon collider

First look at the calorimeter hits

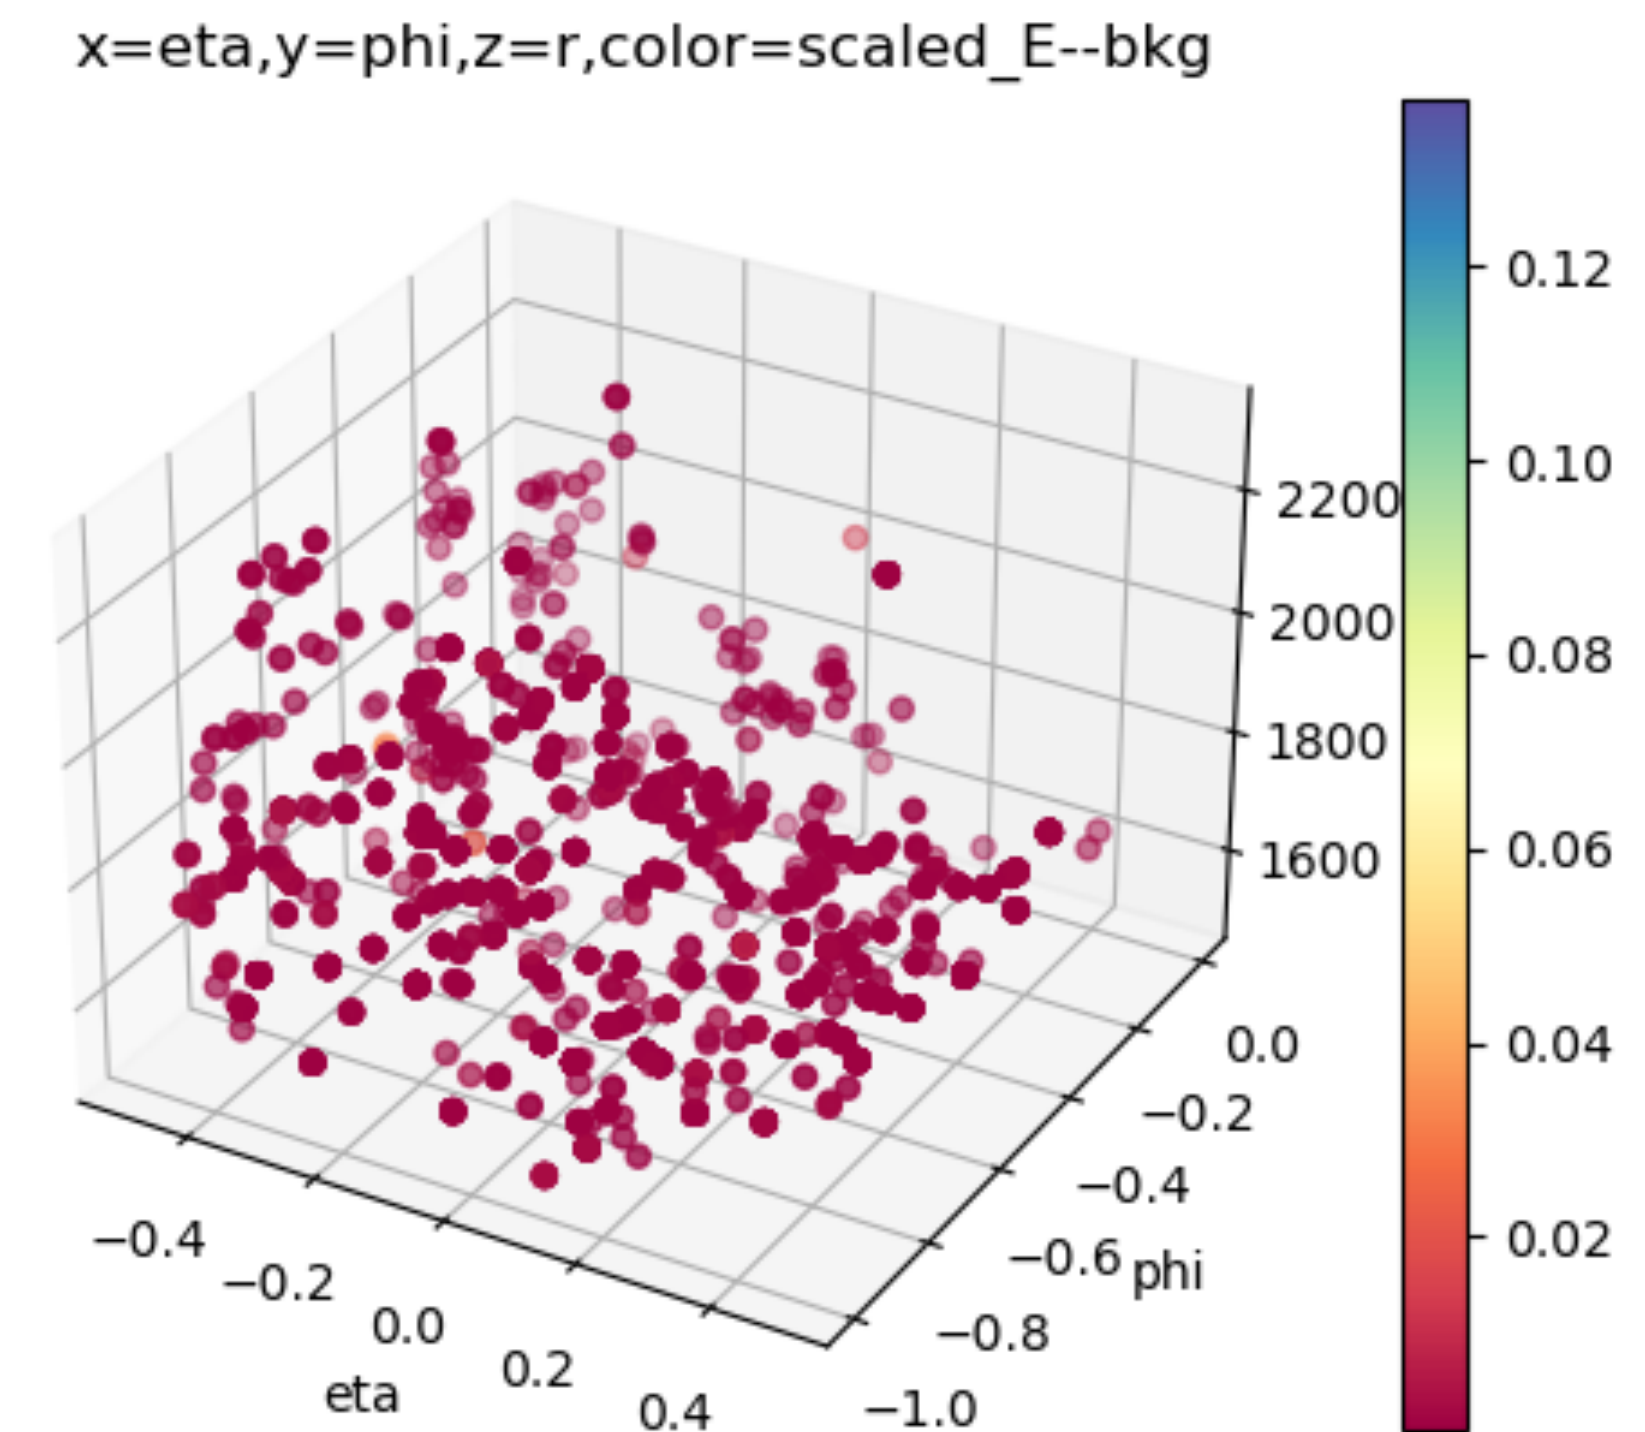

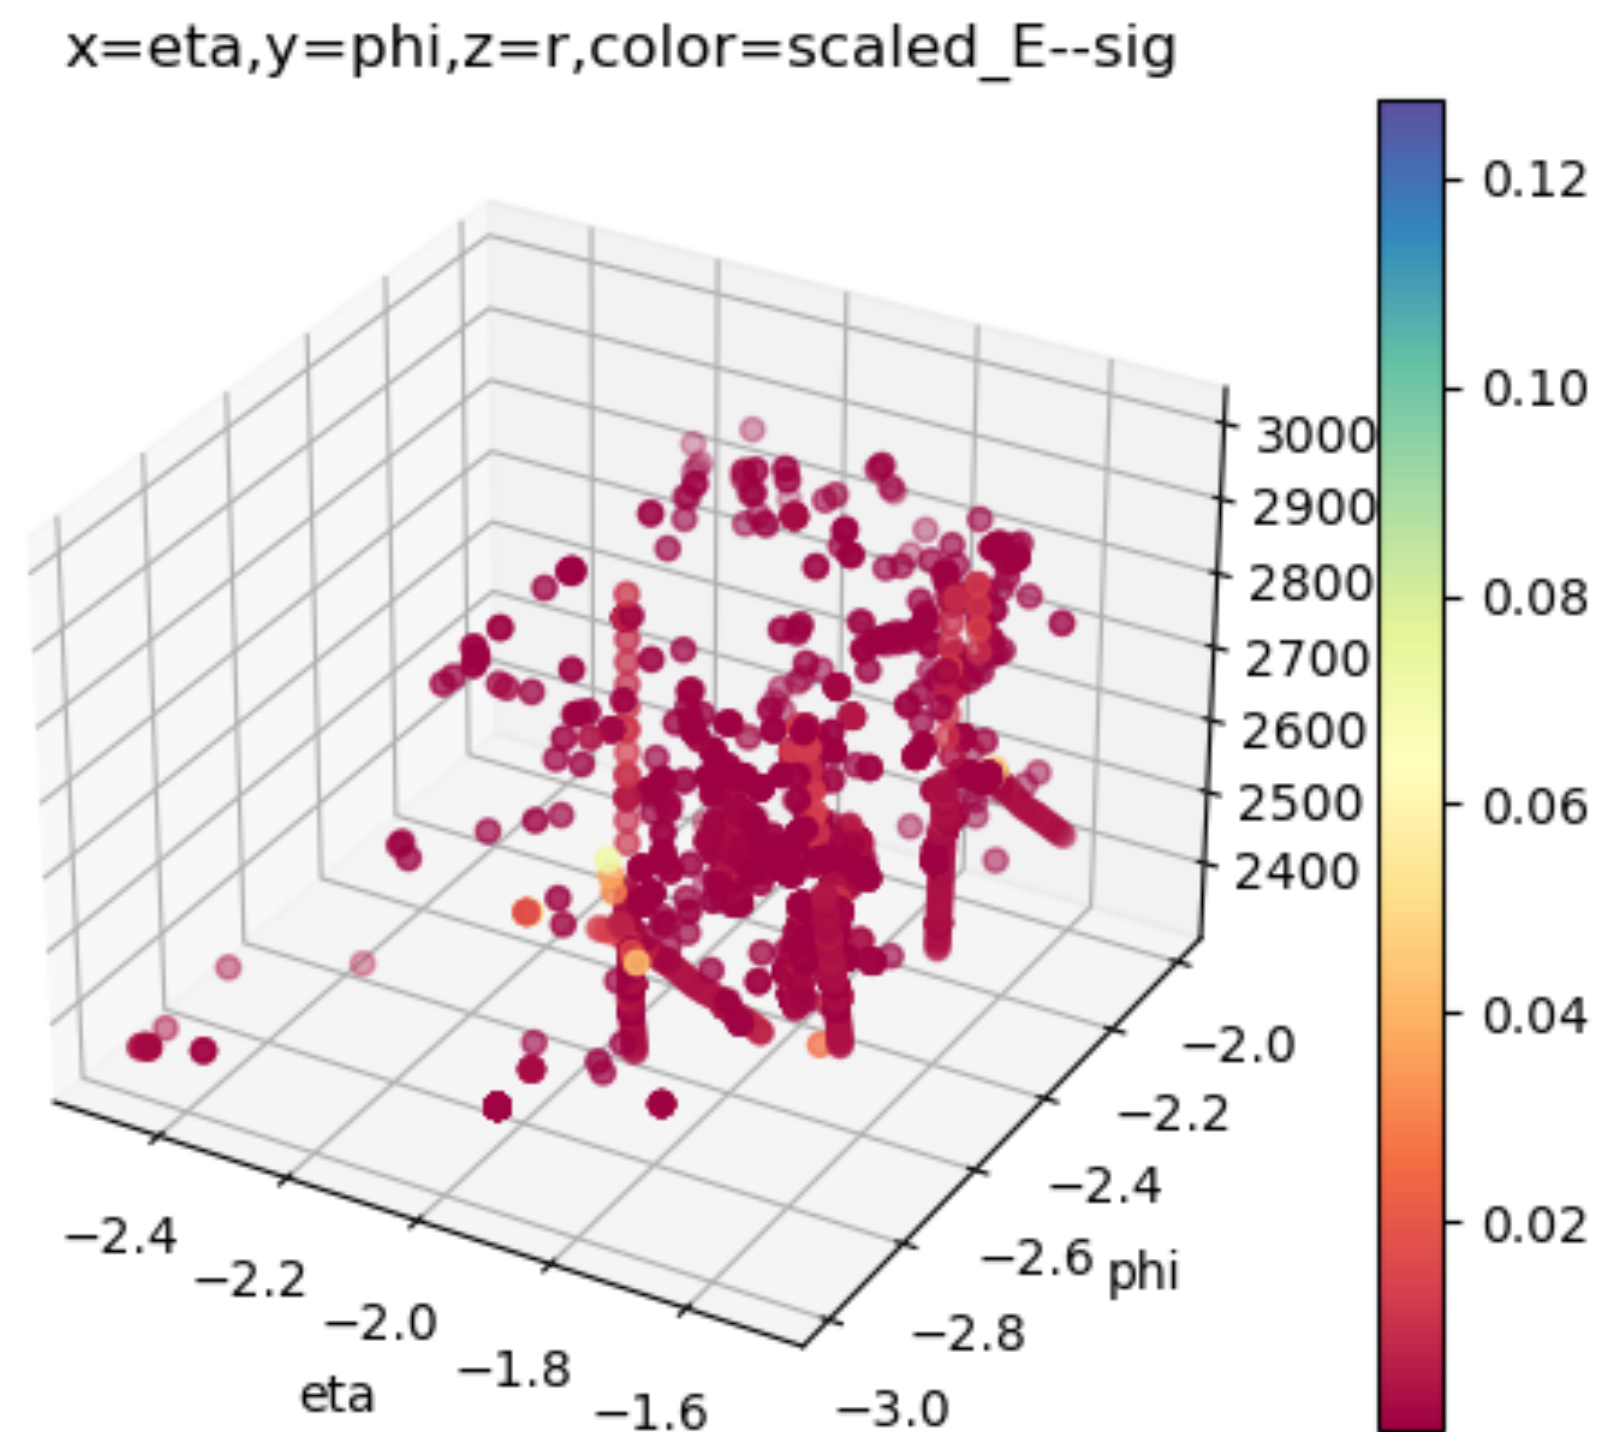

Overview

- Signal : `mumu_H_bb_3TeV`
- Background : BIB
- Available events: 10 bkg and 1000 sig
- Last week we discussed that the available events might not fully represent the level of BIB that we might see
- Trying out possible strategies we could use, actual strategy can be decided once we have larger set of events with realistic BIB.
- Putting the workflow in place to analyse the available events

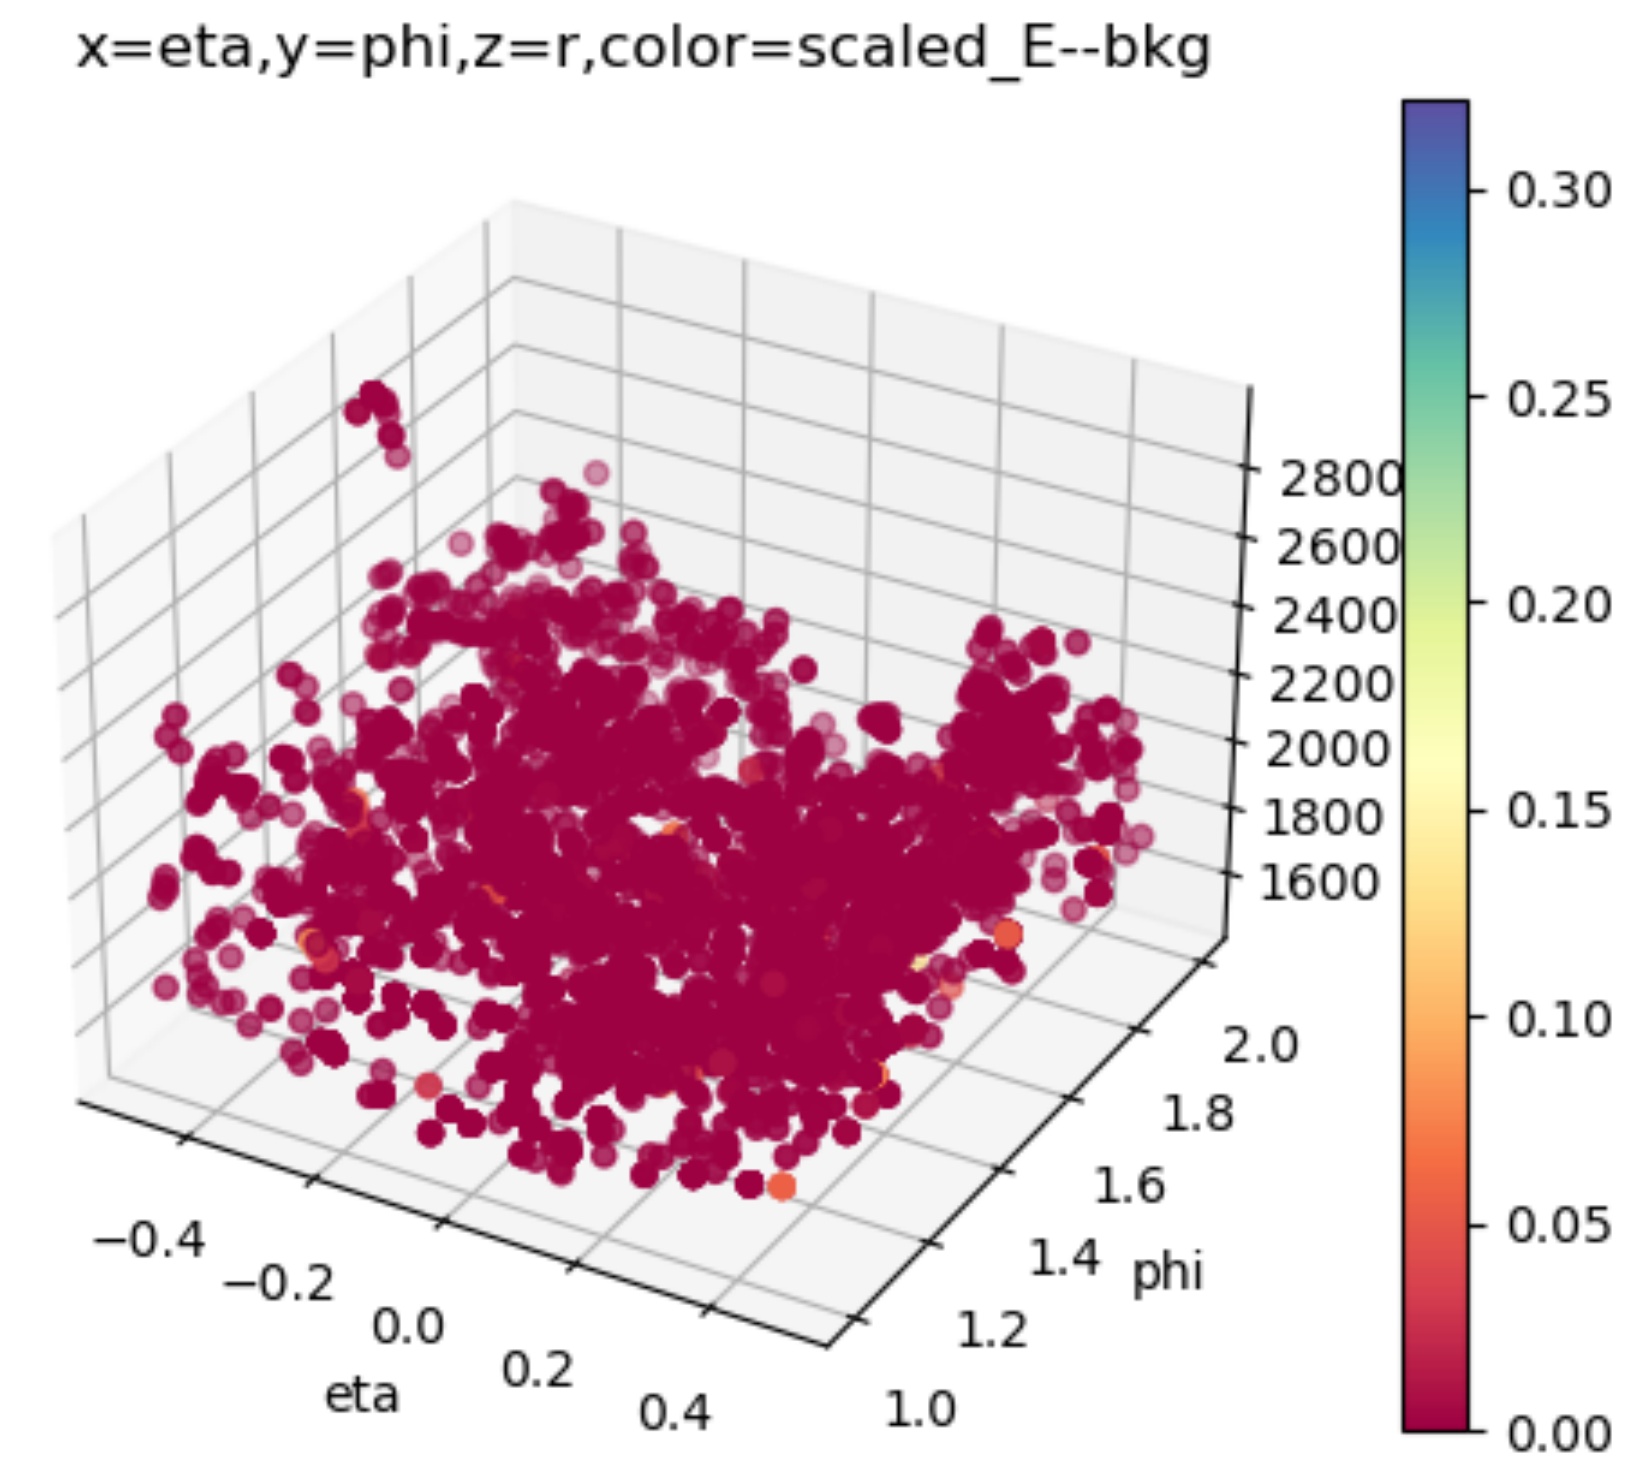

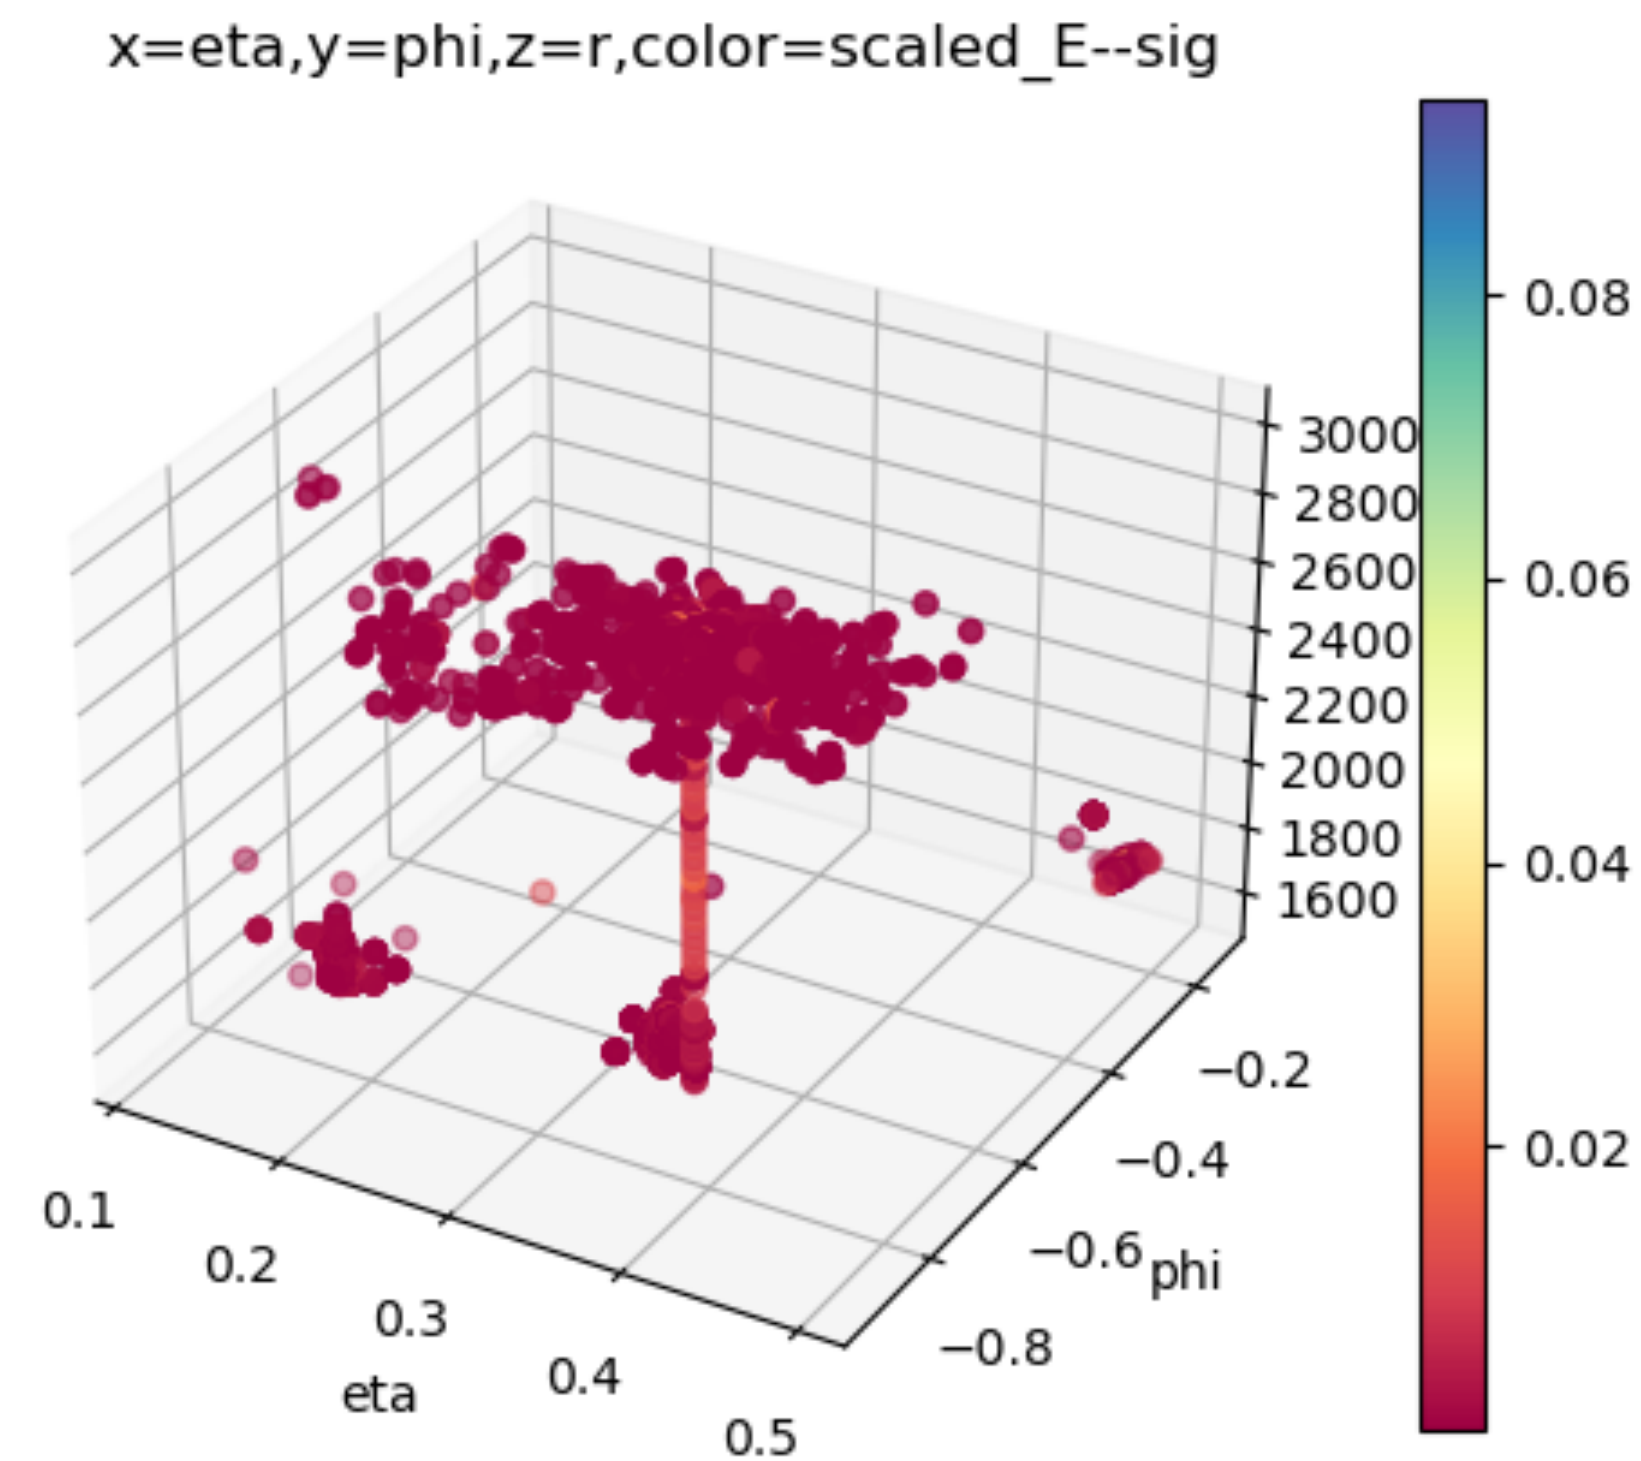

Some interesting sig and bkg hit collections
