# Uncertainty induced by $\alpha_s$ in the PDF analyses

Questions addressed:

- Two leading theoretical uncertainties in LHC processes are due to α<sub>s</sub> and the PDFs; how can one quantify their correlation?
- ► Which central  $\alpha_s(M_Z)$  and which error on  $\alpha_s(M_Z)$  are to be used with the existing PDFs?
- ▶ What are the consequences for key LHC processes  $(gg \rightarrow H^0, \text{ etc.})$ ?
- recent activities on this issue:
  - **MSTW** (*arXiv:0905.3531*)
  - NNPDF (in 2009 Les Houches Proceedings, arXiv: 1004.0962)
  - H1+ZEUS (arXiv:0911.0884)

# Our findings (arXiv:1004.4624)

#### Theorem

In the quadratic approximation, the total  $\alpha_s$ +PDF uncertainty  $\Delta X$ , with all correlation, reduces to

$$\Delta X = \sqrt{\Delta X_{PDF}^2 + \Delta X_{\alpha_s}^2},$$

where

- $\Delta X_{PDF}$  is the PDF uncertainty with fixed  $\alpha_s$ , e.g. uncertainty from 44 CTEQ6.6 PDFs with the same  $\alpha_s(M_Z) = 0.118$
- $\Delta X_{\alpha_s} = (X_{high} X_{low})/2$  is the  $\alpha_s$  uncertainty computed with upper/lower  $\alpha_s$  PDFs, e.g. CTEQ6.6AS PDFs for  $\alpha_s(M_Z) = 0.120$  and 0.116

Back-up slides: The main idea illustrated; key cross sections tabulated The full proof is given in the paper

Hung-Liang Lai (TMUE & MSU)

Pheno 2010

# CT10 analysis (in progress)

#### **Experimental data**

- Combined HERA-1 neutral-current and charged-current DIS data with 114 correlated systematic effects (see Guzzi's talk)
  - replaces 11 separate HERA-1 sets used in the CTEQ6.6 fit
- CDF Run-2 and D0 Run-2 inclusive jet production
- Tevatron Run-2 Z rapidity distributions from both CDF and D0
- W electron asymmetry from CDF II and D0 II; W muon asymmetry from D0 II (CT10W set)
- Other data sets inherited from CTEQ6.6

- 4 同 ト 4 三 ト

# CT10 analysis (in progress)

#### **Developments in techniques**

- Experimental normalizations N<sub>i</sub> are treated on the same footing as other correlated systematic errors
- Set all data weights of 1, unless otherwise specified
- Require 90% CL for each experiment dynamically
- More flexible (i.e. less biased) parametrizations for  $g(x, Q_0)$ ,  $d(x, Q_0)$ , and  $s(x, Q_0)$
- Apply soft constraint on  $R_s = \lim_{x \to 0} \left( s(x) + \bar{s}(x) \right) / \left( \bar{u}(x) + \bar{d}(x) \right)$  which has little information from current data

イロト イ押ト イヨト イヨト

#### More flexible parametrizations CT10(green) vs. CTEQ6.6(blue); PRELIMINARY

g at Q=2 GeV

g(x,Q): large uncertainty at  $x < 10^{-3}$ , despite tighter constraints by the combined HERA data

s(x,Q): wider uncertainty, covers both CTEQ6.6 and MSTW'08

## Agreement between data sets

- Good overall agreement:  $\chi^2/d.o.f. = 1.1$  (out of ~2800 data points)
- Noticable observations on the quality of the fit:
  - Tevatron single-inclusive jet production: Run-1 and Run-2 sets are moderately compatible (arXiv:0904.2424)
  - Tevatron Run-2 Z rapidity: D0 well described; CDF acceptable (higher stat.)
  - Tevatron Run-2 W lepton asymmetry
    - $\diamond$  is precise; constrains d(x)/u(x) at  $x \to 1$
    - $\diamond$  apparently disagrees with existing constraints on d/u, mainly provided by the NMC  $F_2^d/F_2^p$  and Run-1 W lepton asymmetry data; minor tension against BCDMS  $F_2^d$  data

・ロト ・ 同ト ・ ヨト ・ ヨト - - ヨ

## Agreement between data sets

- Reaonable fits to electron (e) asymmetry data are possible without NMC and BCDMS; and vice versa
- No acceptable fit to D0 II e asymmetry and NMC/BCDMS data can be achieved, if they are included on the same footing
- **Tension** between Run-2 e asymmetry and  $\mu$  asymmetry
- Good agreement between Run-2 *e W* asymmetry data and *Z* y data
- With special emphasis on D0 II *e* asymmetry data (weight>1), it is possible to obtain a reasonable agreement for *W* asymmetry ( $\chi^2/d.o.f. = 1 - 2$ ), with some remaining tension with NMC & BCDMS data, especially at x > 0.4

Two series of PDFs are produced:

- ▶ CT10: no D0 Run-2 W asymmetry data are included
- CT10W: include D0 Run-2 W asymmetry, with an extra weight

# CT10 and CT10W fits with Tevatron Run-2 data

#### PRELIMINARY

CT10W agrees better with W asy data; has smaller uncertainty than CTEQ6.6 or CT10

Hung-Liang Lai (TMUE & MSU)

d(x,Q)/u(x,Q) at Q = 85 GeV

CT10W prefers larger d/u, has smaller uncertainty than CTEQ6.6 or CT10

## CT10 & CT10W predictions for the LHC & Tevatron

A B > A B >

PRELIMINARY

-

# CT10 & CT10W predictions for the LHC

CT10W Uncertainty (red) is clearly smaller than that of CT10 & CTEQ6.6.

CT10 (green) & CT10W (red) uncertainties in central *y* region are larger than that of CTEQ6.6 (blue), mainly due to larger uncertainty on *s* distribution.

## Summary I

#### CTEQ6.6AS PDF sets (available in the LHAPDF library):

from 4 alternative CTEQ6.6 fits for

 $\alpha_s(M_Z) = 0.116, .117, .119, .120$ 

- sufficient to compute uncertainty in  $\alpha_s(M_Z)$  at  $\approx$ 68% and 90% C. L., including the world-average  $\alpha_s(M_Z) = 0.118 \pm 0.002$  as an input data point
- **The CTEQ6.6AS**  $\alpha_s$  uncertainty should be combined with the CTEQ6.6 PDF uncertainty as

$$\Delta X = \sqrt{\Delta X_{CTEQ6.6}^2 + \Delta X_{CTEQ6.6AS}^2}$$

The total uncertainty  $\Delta X$  reproduces the full correlation between  $\alpha_s(M_Z)$  and PDFs, also applicable to CT10 family and future PDFs.

Hung-Liang Lai (TMUE & MSU)

## Summary II

#### Tevatron Run-2 W asymmetry data...

...become increasingly complete and precise (measurements by both CDF and D0; electron and muon channels)

...cannot be explained based on the d/u ratio provided by the previously existing data

Several cross checks of the theoretical calculation for W asymmetry; no problems were found

Higher-twist and nuclear corrections in the large-x BCDMS/NMC deuterium data are the usual suspects

(Virchaux and Milsztajn; Alekhin; Accardi et al.)

CT10 and CT10W sets of PDFs for practical applications, without and with constraints from the D0 Run-2 W asymmetry
