

# Measurement of $A_{\text{FB}}$ and extraction of $\sin^2\theta_{\text{W}}$ using $p\bar{p}\rightarrow Z/\gamma^*\rightarrow e^+e^-$ events at DØ

Junjie Zhu

State University of New York @ Stony Brook

For the DØ Collaboration

**PHENO 2008**

April 28, 2008

◆ Vector and axial-vector coupling of fermions to the Z bosons:

$$g_V = I_f^3 - 2Q_f \sin^2 \theta_W$$

$$g_A = I_f^3$$

Fermion			$I_f^3$	$Q_f$	$g_V$	$g_A$
u	c	t	1/2	2/3	$(1/2 - 4/3 \times \sin^2 \theta_W) \sim 0.191$	1/2
d	s	b	-1/2	-1/3	$(-1/2 + 2/3 \times \sin^2 \theta_W) \sim -0.345$	-1/2
$\nu_e$	$\nu_\mu$	$\nu_\tau$	1/2	0	1/2	1/2
e	$\mu$	$\tau$	-1/2	-1	$(-1/2 + 2 \times \sin^2 \theta_W) \sim -0.036$	-1/2

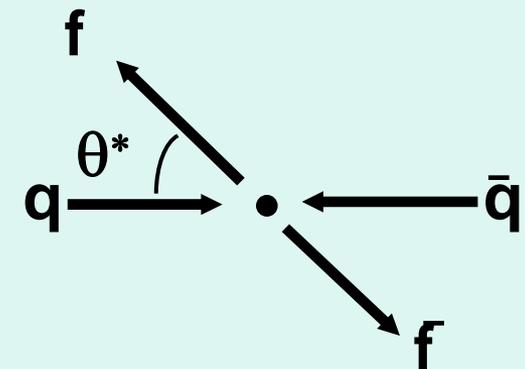

◆  $\theta^*$ -dependent cross sections:

$$d\sigma/d\cos \theta^* = A \times (1 + \cos^2 \theta^*) + B \times \cos \theta^*$$

A and B depend on  $I_f^3$ ,  $Q_f$  and  $\sin^2 \theta_W$

$$A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B} = \frac{\sigma(\cos \theta^* > 0) - \sigma(\cos \theta^* < 0)}{\sigma(\cos \theta^* > 0) + \sigma(\cos \theta^* < 0)} = \frac{3B}{8A}$$

◆ Directly probing the Z-quark and Z-lepton couplings

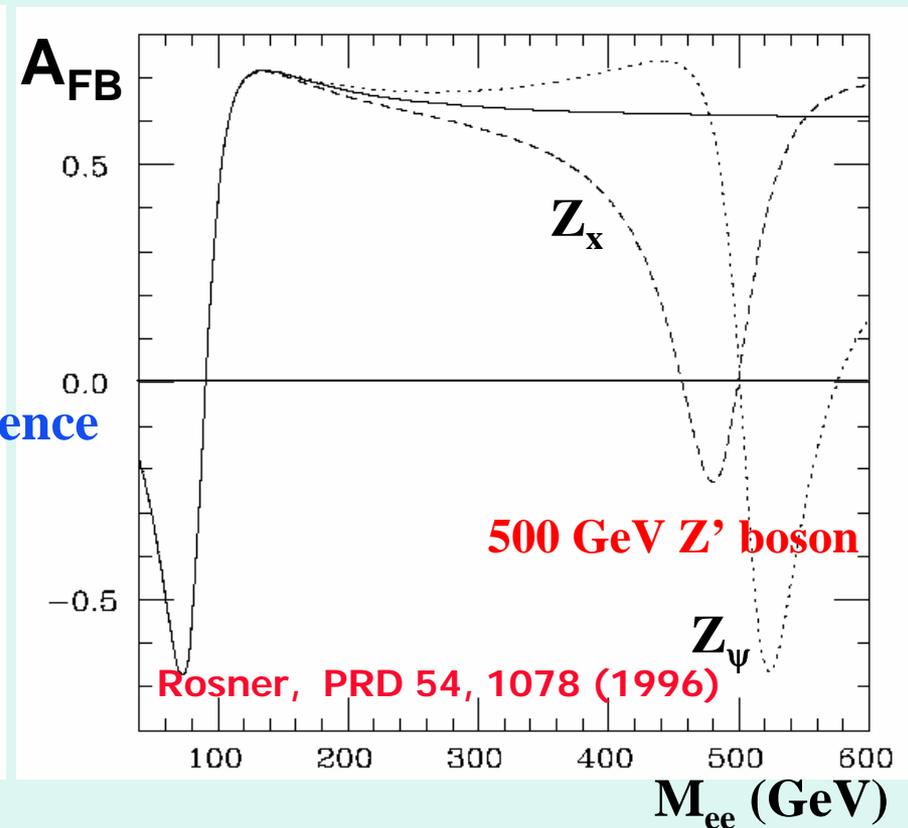

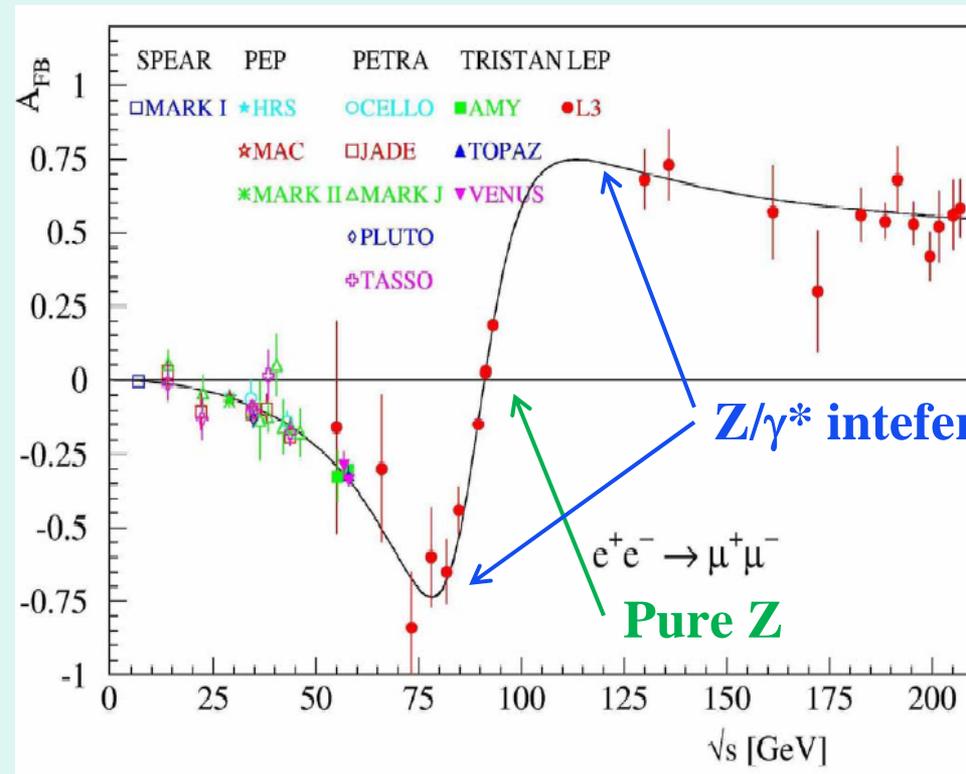

Collins-Soper frame

# $A_{FB}$ at $e^+e^-$ collider and hadron collider

- ◆ Precise measurement around Z pole
- ◆ Hard to reach very high energies (> 200 GeV)
- ◆ New resonance ( $Z'$ , LED etc) can interfere with Z and  $\gamma$  (M. Carena *et al.*, PRD 70 093009 (2004))

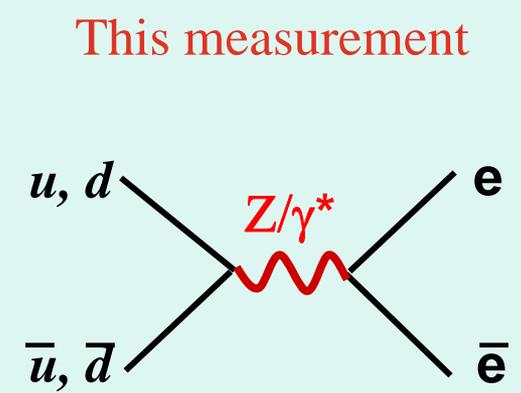

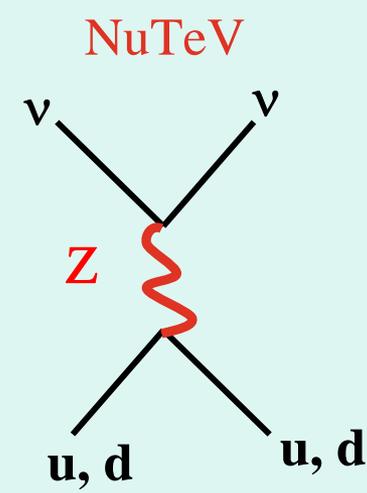

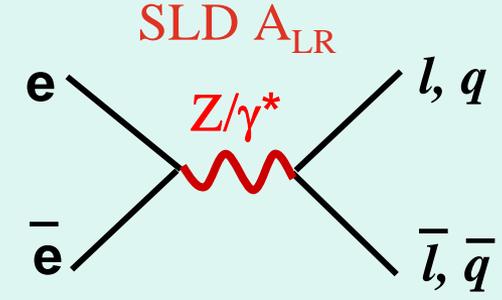

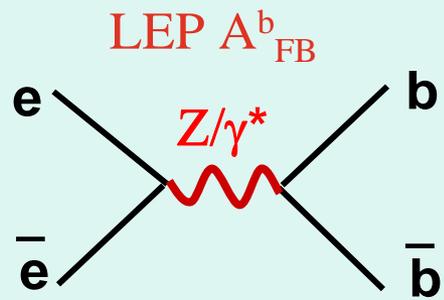

# Weak mixing angle $\sin^2\theta_W$

- ◆  $A_{FB}$  is sensitive to  $\sin^2\theta_W$  ( $\sin^2\theta_W^{\text{eff}}$  includes higher order corrections)
- ◆ LEP  $A_{FB}^b$  and SLD  $A_{LR}$ : off by  $3\sigma$  in opposite direction
- ◆ NuTeV  $\sin^2\theta_W$  result:  $3\sigma$  away from the global EW fit

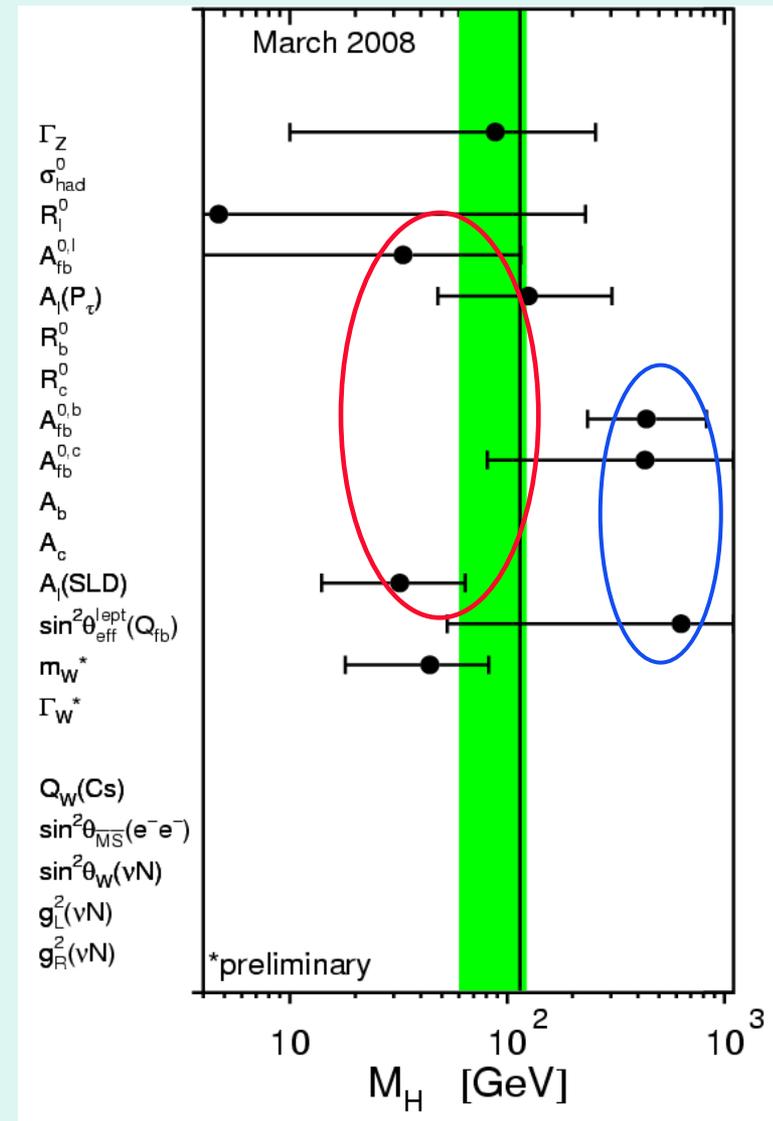

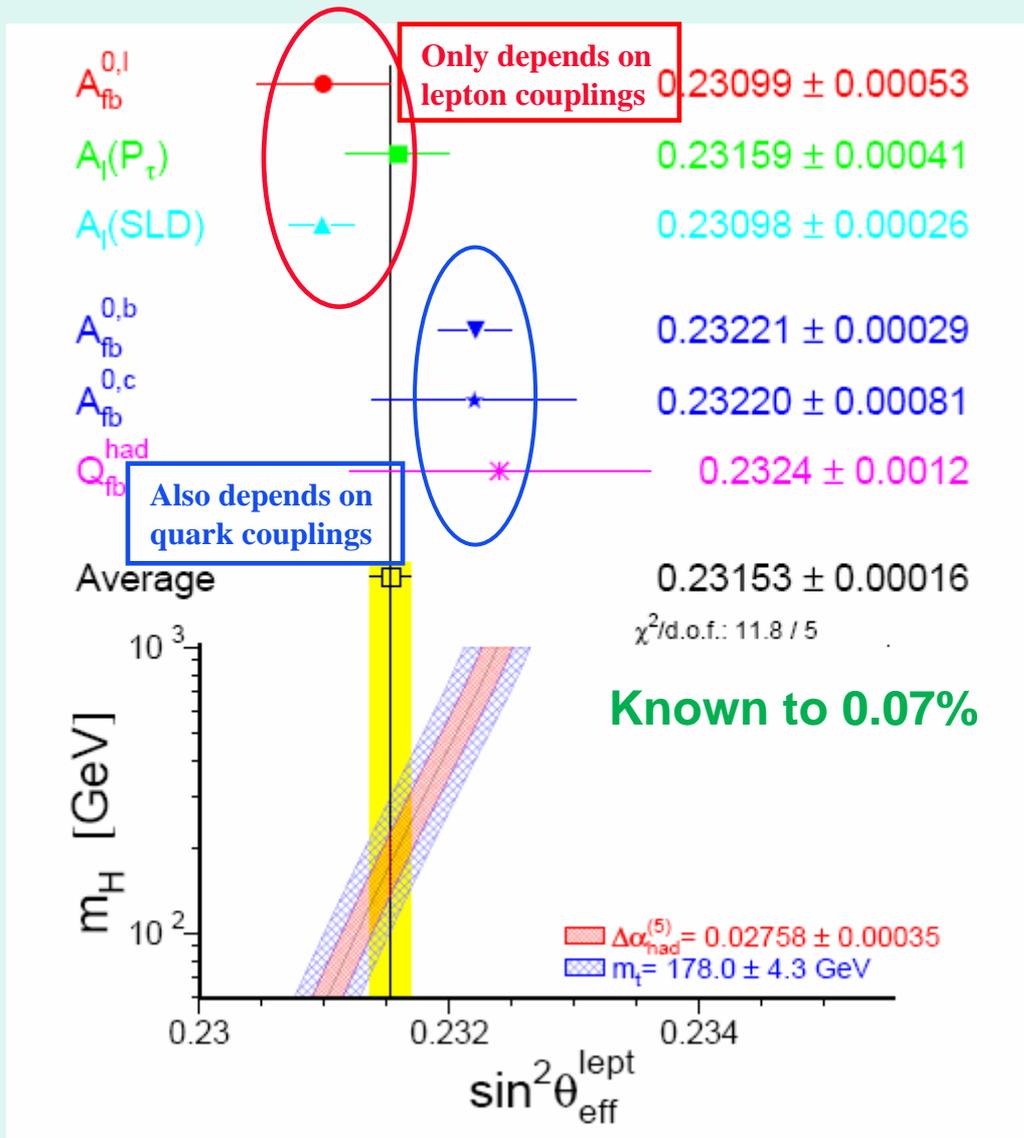

## LEP EWWG, Phys. Rep. 427, 257 (2006)

G.P. Zeller *et al.*, PRL 88, 091802 (2002)

# Weak mixing angle $\sin^2\theta_W$ (cont.)

# DØ detector

- ◆ Silicon Microstrip Tracker and Central Fiber Tracker (Tracks  $|\eta| < 3.2$ )
- ◆ Central and endcap calorimeters (Electrons  $|\eta| < 4.2$ )

◆ Run II data:  $1065 \pm 65 \text{ pb}^{-1}$  ( $Z/\gamma^* \rightarrow ee$ )

◆ Two electrons satisfy:

◆  $p_T > 25 \text{ GeV}$

◆ Isolated with large EM fraction

◆ Shower shape consistent with that of an electron

◆  $50 < M_{ee} < 500 \text{ GeV}$

◆ Look at CC and CE events

◆ 35,626 events after selection

◆ 558 events with  $130 < M_{ee} < 500 \text{ GeV}$

◆  $A_{FB}$  measured in 14 mass bins

Mass range (GeV)	CC		CE	
	Forward	Backward	Forward	Backward
50 – 60	69	78	15	16
60 – 70	104	158	51	91
70 – 75	96	117	64	93
75 – 81	191	235	172	293
81 – 86.5	749	763	843	970
86.5 – 89.5	1388	1357	1860	1694
89.5 – 92	2013	1918	2543	2214
92 – 97	2914	2764	3132	2582
97 – 105	686	549	867	470
105 – 115	153	97	243	88
115 – 130	101	39	167	61
130 – 180	91	33	202	69
180 – 250	31	13	53	16
250 – 500	14	15	17	4

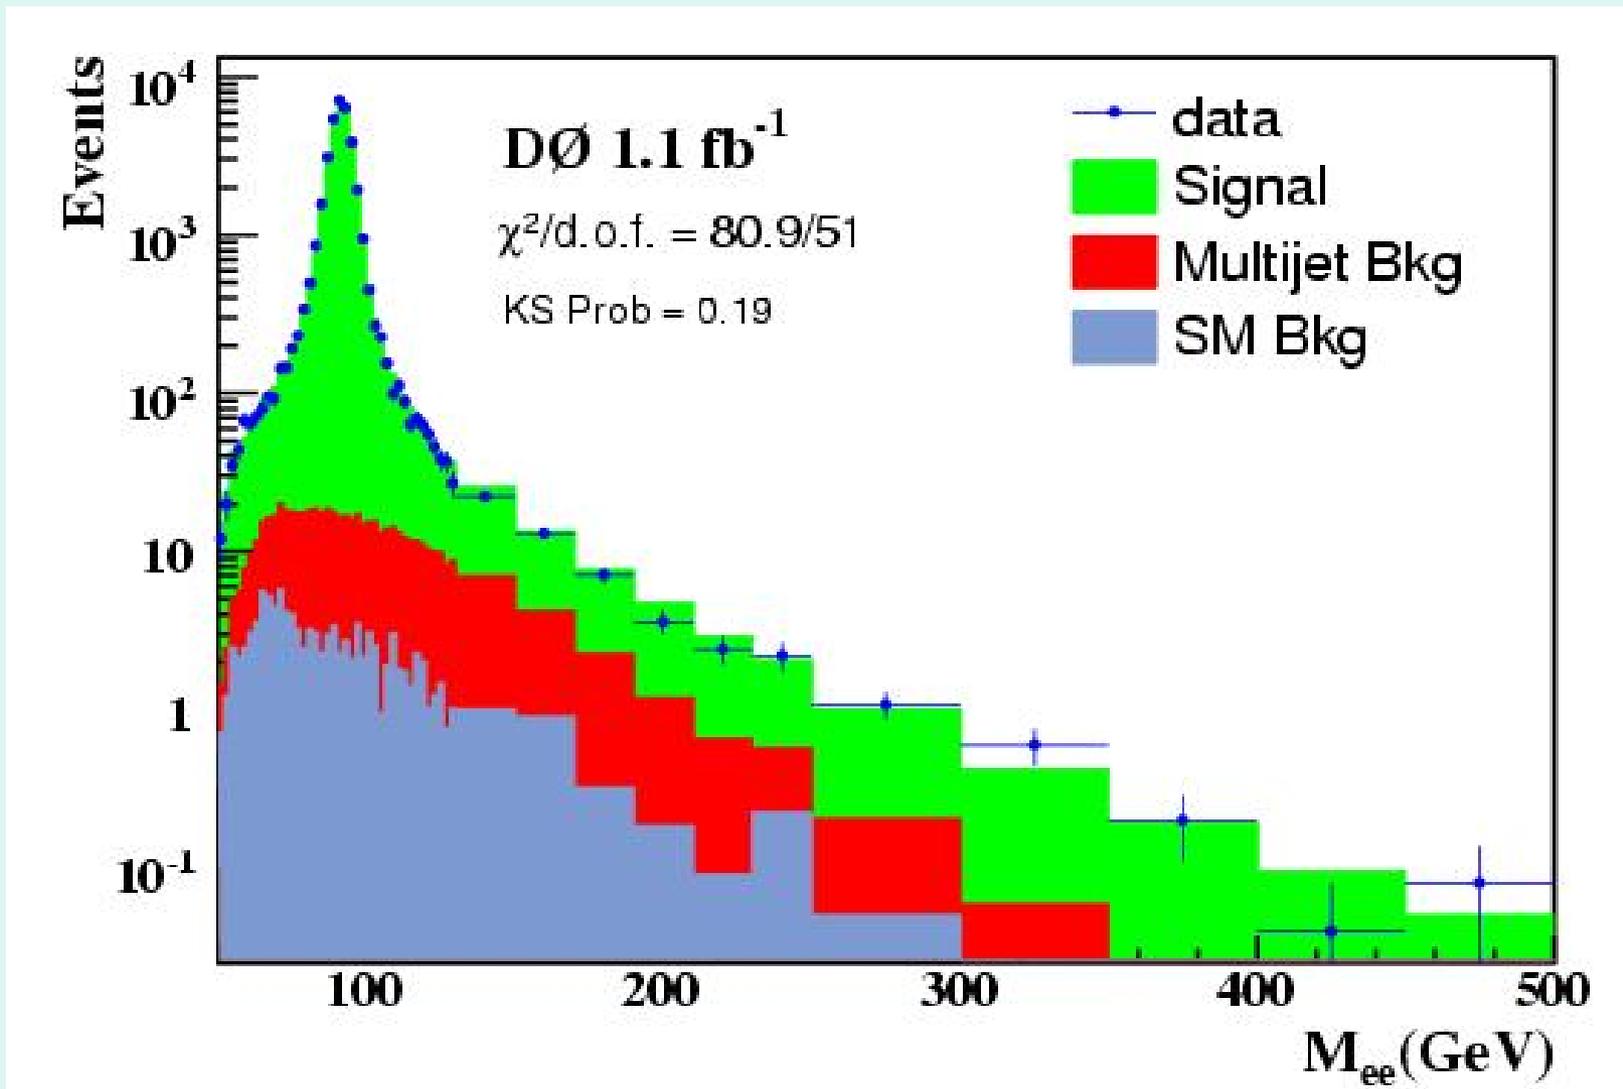

## ◆ Signal events:

- ◆ PYTHIA events with  $15 < M < 1000$  GeV
- ◆ Passed through the GEANT simulation of DØ detector
- ◆ Efficiencies, energy scale and resolution tuned to agree with data

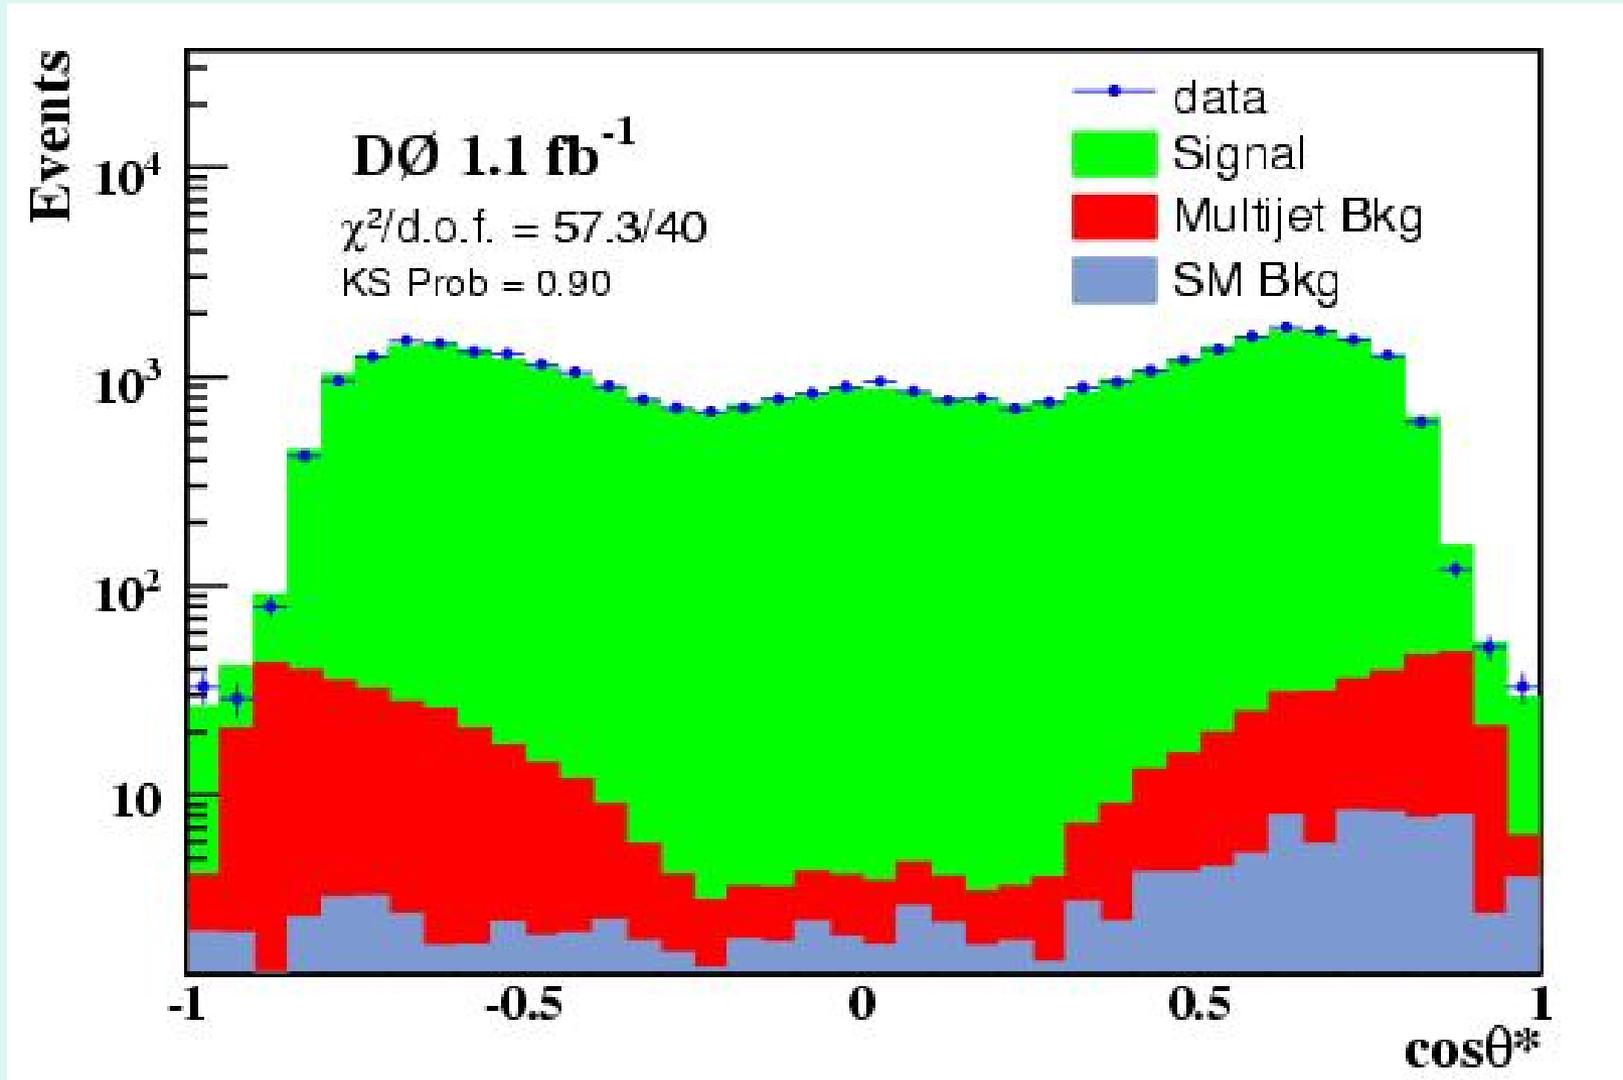

## ◆ Backgrounds:

- ◆ Electroweak backgrounds measured using GEANT MC simulation:
  - ◆  $Z/\gamma^* \rightarrow \tau\tau, W+X, WW, WZ, t\bar{t}$
  - ◆ Negligible for most mass bins
- ◆ QCD multijet backgrounds measured using real data:
  - ◆ Invert electron shower shape requirements
  - ◆ 0.9% for the whole mass bins

# $M_{ee}$ distribution

# $\cos\theta^*$ distribution

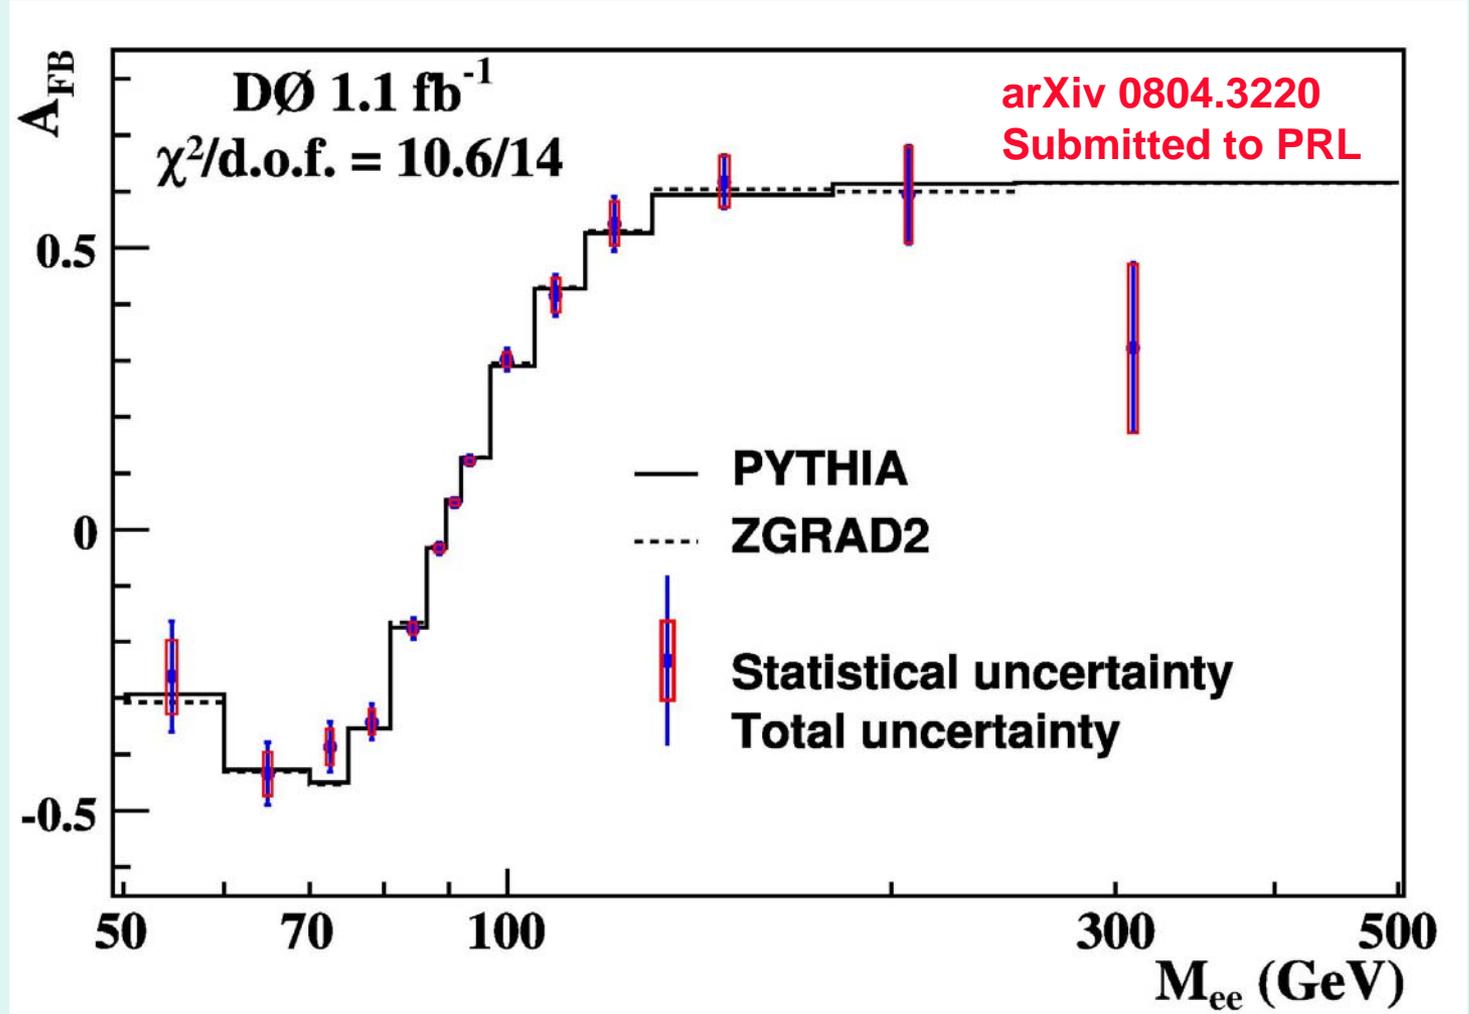

- ◆ Extraction of  $\sin^2\theta_W^{\text{eff}}$  using PYTHIA:
  - ◆ Obtained from backgrounds-subtracted  $A_{\text{FB}}$  distribution
  - ◆ Compared with  $A_{\text{FB}}$  templates according to different values of  $\sin^2\theta_W^{\text{eff}}$  generated with PYTHIA and GEANT-based MC simulation
- ◆ Higher-order QCD and EW corrections estimated using ZGRAD2 program (U. Baur *et al.*, PRD 57, 199 (1998); PRD 65, 033007 (2002))
  - ◆  $\sin^2\theta_W^{\text{eff}} = 0.2327 \pm 0.0018$  (Stat.)  $\pm 0.0006$  (syst.)
  - ◆ Systematic uncertainties dominated by PDFs (0.0005) and EM energy scale/resolution (0.0003)
- ◆ Our result agrees with the global EW fit
- ◆ Uncertainty comparable with the uncertainties from LEP inclusive hadron charge asymmetry ( $Q_{\text{FB}}^{\text{had}}$ ) (0.0012) and NuTeV measurement (0.0016)

- ◆ Raw  $A_{FB}$  → Unfolded  $A_{FB}$  (compare with theoretical predictions easily)
  - ◆ Detector resolution
  - ◆ Acceptance and selection efficiencies
  - ◆ Charge mis-identification
- ◆ Procedure tested by comparing the true and unfolded spectrum generated using pseudo-experiments
- ◆ Systematic uncertainty on the unfolded  $A_{FB}$ 
  - ◆ Corrections used for unfolding
  - ◆ Electron energy scale and resolution
  - ◆ Backgrounds
  - ◆ PDFs

# Unfolded $A_{FB}$

84.4	-0.174	-0.166	$-0.176 \pm 0.012 \pm 0.014$
88.4	-0.033	-0.031	$-0.034 \pm 0.007 \pm 0.008$
90.9	0.051	0.052	$0.048 \pm 0.006 \pm 0.005$
93.4	0.127	0.129	$0.122 \pm 0.006 \pm 0.007$
99.9	0.289	0.296	$0.301 \pm 0.013 \pm 0.015$
109.1	0.427	0.429	$0.416 \pm 0.030 \pm 0.022$
121.3	0.526	0.530	$0.543 \pm 0.039 \pm 0.028$
147.9	0.593	0.603	$0.617 \pm 0.046 \pm 0.013$
206.4	0.613	0.600	$0.594 \pm 0.085 \pm 0.016$
310.5	0.616	0.615	$0.320 \pm 0.150 \pm 0.018$

◆ Stat and syst uncertainties are comparable near Z-pole

◆ Stat uncertainty dominates at high mass

- ◆ Measure  $A_{\text{FB}}$  and extraction of  $\sin^2\theta_{\text{W}}^{\text{eff}}$  using  $1.1 \text{ fb}^{-1}$  DØ RunII data
- ◆  $A_{\text{FB}}$  measurement:
  - ◆ Unfolded  $A_{\text{FB}}$  agrees with SM predictions
  - ◆ About ten times more data used than previous results
- ◆  $\sin^2\theta_{\text{W}}^{\text{eff}}$  extraction:
  - ◆  $\sin^2\theta_{\text{W}}^{\text{eff}} = 0.2327 \pm 0.0018 \text{ (stat.)} \pm 0.0006 \text{ (syst.)}$
  - ◆ Result agrees with the global EW fit
  - ◆ Only electron channel used, the precision is comparable with the uncertainty of LEP  $Q_{\text{FB}}^{\text{had}}$  and that of NuTeV measurement
  - ◆ With  $\sim 8\text{fb}^{-1}$  data, using  $e + \mu$  channels with CDF, expected uncertainty will be comparable with WA uncertainty
  - ◆ Will benefit from the improvements in current MC generators incorporating higher order QCD and EW corrections

# BACKUP

Fermion			$g_V$	$g_A$	$A_f$	$\partial A_f / \partial \sin^2 \theta_W$
u	c	t	0.191	0.5	0.66	-3.5
d	s	b	-0.345	-0.5	0.94	-0.6
$\nu_e$	$\nu_\mu$	$\nu_\tau$	0.5	0.5	1.00	0
e	$\mu$	$\tau$	-0.036	-0.5	0.16	-7.9

◆ Left- and right-handed couplings:

$$g_V = g_L + g_R, \quad g_A = g_L - g_R$$

◆ Fermion asymmetry parameter:

$$A_f = 2g_V g_A / (g_V^2 + g_A^2)$$

◆ At  $e^+e^-$  collider:

◆ Forward-backward asymmetry:  $A_{FB}^f = (\sigma_F^f - \sigma_B^f) / (\sigma_F^f + \sigma_B^f) = 0.75 A_e A_f$

◆ Left-right F/B asymmetry (direct measurement of final-state coupling)

$$A_{FB}^{LR} = [(\sigma_F^L - \sigma_F^R) - (\sigma_B^L - \sigma_B^R)] / [(\sigma_{F+}^L \sigma_F^R) + (\sigma_{F+}^L \sigma_F^R)] = 0.75 P_e A_f$$

◆ Left-right asymmetry:  $A_{LR} = (\sigma_L - \sigma_R) / (\sigma_{L+} \sigma_R) = P_e A_e$

◆ Measurement of  $A_{LR}$ ,  $A_{LR}^{FB}$ ,  $A_{FB}^l$  at SLD:

- ◆ Excludes electron mode to avoid the added complexity of correcting for t-channel interference
- ◆ Determination of the beam polarization

◆ Measurement of  $A_{FB}^l$  at LEP

◆ Measurement of  $P^\tau$  ( $\tau$  polarization)

◆ Measurement of  $A_{FB}^b$ ,  $A_{FB}^c$

- ◆ Use lepton tag:  $P$  and  $P_T$  of leptons can be used to assign a probability that the lepton is a  $b$  or a  $c$  quark
- ◆ Sign of the lepton tags the quark charge

◆ Measurement of  $Q_{FB}^{had}$ :

- ◆ Use momentum-weighted jet charge to tag the quark charge
- ◆ Relies on MC to determine the relative abundance of the different quark species

# $\sin^2\theta_w^{\text{eff}}$ depends on scale

- Moller scattering
- $\nu$ -nucleon scattering
- Atomic parity violation in Cesium
